Technologies For Detection Of Dna Damage And Mutations:

Technologies for Detection of DNA Damage and Mutations G.P. Pfeifer, 2013-11-11 Man made carcinogens natural genotoxic agents in the environment as well as ionizing and ultraviolet radiation can damage DNA and are a constant threat to genome integrity Throughout the evolution of life complex DNA repair systems have developed in all living organisms to cope with this damage Unrepaired DNA lesions can promote genetic alterations mutations that may be linked to an altered phenotype and if growth controlling genes are involved these mutations can lead to cell transformation and the development of malignant tumors Proto oncogenes and tumor suppressor genes may be critical targets for DNA damaging agents In a number of animal model systems correlations between exposure to a carcinogen tumor development and genetic changes in tumor DNA have been established To understand mutagenesis processes in more detail at the molecular level we need to know the type and frequency of DNA adducts within cells their distribution along genes and specific DNA sequences as well as the rates at which they are repaired We also need to know what types of mutations are produced and which gene positions are most prone to mutagenesis This book provides a collection of techniques that are useful in mutagenesis research The book is divided into three parts In Part I methods for DNA damage and repair analysis are provided

Technologies for Detection of DNA Damage and Mutations G.P. Pfeifer, 1996-07-31 Useful and timely Mutagenesis Of considerable value Journal of Medical Genetics Quite readable a comprehensive overview perfectly covers the needs of those researchers who have to decide on the best strategy to identify damage or mutations at the molecular level Trends in Cell Biology The formats of the presentations are uniform and ample and up to date references are provided at the end of each chapter will be welcomed by postgraduate researchers of all ages and should retain its usefulness for a long time Endeavour 21 4 1997 This important resource thoroughly reviews a wide range of techniques used in mutagenesis research ranging from established techniques to recently developed methodologies based on the polymerase chain reaction DNA damage analysis DNA repair assays and mutation detection are a few of the techniques featured Chapters present detailed experimental protocols benefiting researchers and students in the fields of toxicology biotechniques molecular biology photobiology medical genetics and oncology

Mutation Detection R. G. H. Cotton, E. Edkins, S. Forrest, 1998-02-05 Mutation detection is increasingly undertaken in a wide spectrum of research areas in medicine it is fundamental in isolating disease genes and diagnosis and is especially important in cancer research in biology commercially important genes can be identified by the mutations they contain But mutation detection is time consuming and expensive This volume offers the latest tried and tested protocols for a range of detection methods from the labs of the leading researchers in the field

DNA Damage Recognition Wolfram Siede, Paul W. Doetsch, 2005-09-19 Stands as the most comprehensive guide to the subject covering every essential topic related to DNA damage identification and repair Covering a wide array of topics from bacteria to human cells this book summarizes recent developments in DNA damage repair and recognition while providing timely reviews on the molecular

McGregor, S. Venitt, 1999 Lifetime assays for carcinogenicity in experimental animals together with data on genetic and related effects on a variety of organisms have long been the foundation for predictions of carcinogenic hazard to human beings Recent scientific advances have provided new assays and novel test systems that are beginning to supplement and in the future may even replace the well established tests that have been widely used for the last four decades This publication reviews the evidence that justifies the use of lesions that precede histologically defined malignancy as

endpoints to predict carcinogenicity It evaluates the utility of non mammalian species and of genetically engineered rodents as subjects for carcinogenicity tests and mutations in cancer related genes in human and experimental animal tumours as footprints of environmental carcinogens It evaluates the use of established and novel assays for genetic toxicity in the prediction of carcinogenicity Finally it formulates recommendations on the use of such data in the process of evaluation of carcinogenic hazards by the IARC Monographs on the Evaluation of Carcinogenic Risks to Humans

Genes and the Environment Roy H. Burdon, 1999-07-22 Genes and the Environment is concerned with genes and how their structures and activities can be influenced by current relevant environmental adversities The book aims to provide a brief integrated coverage at a biochemical and molecular biological level of the various effects that environmental factors can have on our genes and those of other
