Wilson, 1989-09-25 Written for communications specialists and policy makers this book is a penetrating examination into the rapidly changing approach of states to telecommunications regulation and planning since the divestiture of AT T in January 1984 The editors place particular emphasis on the conjunction between the increasing state role in developing and implementing telecommunications policy and a new interest in economic development on the part of state governments Following a discussion of the major issues surrounding telecommunications regulation and an exploration of the

links between telecommunications and economic development the experiences of nine states are considered in separate chapters The contributors also consider telecommunications applications for improving efficiency in state government The result is a comprehensive look at existing trends in state telecommunications regulation that will be invaluable not only to officials and legislators but also to students of communications policy Each of the nine state chapters includes a profile of the state s social and economic makeup a description of the policy environment a statement of regulatory policy and and analysis of the relationship between telecommunications and economic development in that state A number of chapters also include detailed case studies among them a study of New York s Teleport Nebraska s AGNET and Washington State s 1985

Regulatory Flexibility Act Based on their in depth study of the nine states experiences the editors argue that states need to become better informed about the changing telecommunications environment and its potential for improving efficiency in state government In addition both planning and regulation must be more related to economic development plans than they are currently in most states Finally the editors conclude that traditional state regulation of telecommunications companies is inadequate for establishing policy in this increasingly complex and important area

Telecommunications Karen F. Lomeland Jacobsen,2003 The world economy has experienced an enormous growth the past 50 years Yet the gap between the richest and the poorest countries has increased There have been several attempts to explain the increased differences Proponents of the endogenous growth theory claim that a technological revolution has created a new growth paradigm Following the information technology revolution seen in the industrialised world in the 90s information and communication technology has often been launched as a possible remedy for the slow or decelerating growth developing countries have faced This paper seeks to explore the relationship between telecommunications development and economic growth by performing an econometrical analysis of 61 developing countries and 23 developed countries between 1990 and 1999 By estimating a simultaneous equation model where telecommunication infrastructure investments are endogenised into the aggregated economy and country specific fixed effects are included simultaneous causality and spurious correlation are recognised The results of the analysis indicate that there is a significant correlation between telecommunication and GDP growth Overall there seems to be larger growth effects from telecommunication development in developing countries than in developed countries a result that contradicts earlier findings and the notion of network externalities The report suggests that the indirect effects i e the gain in productivity that other sectors experience as a result of development in the telecommunication sector are more significant in developing countries and this might explain the large growth effects found in these countries
