Tectonic Settings of Regional Metamorphism Royal Society (Great Britain). Discussion Meeting, 1987 Tectonic Settings of Regional Metamorphism E. R. Oxburgh, B. W. D. Yardley, P. C. England, 1987 **Tectonic Settings of Regional Metamorphism** E. R. Oxburgh, B. W. D. Yardley, P. C. England, 1987 **Tectonics and Metamorphism** Bozzano G Luisa, 1976-01-01 Tectonics and Metamorphism **Metamorphic Petrology** Akiho Miyashiro, 1994-01-17 A major international text for intermediate and advanced students of metamorphic petrology **Tectonic Setting and Lithology of the Winterhaven Formation** Gordon Haxel, Richard M. Tosdal, John T. Dillon, 1985 Analyzes the lithology of a sequence of supercrustal rocks in southeasternmost California and southwesternmost Arizona known as the Winterhaven Formation presenting data on its geologic setting stratigraphy metamorphism and deformation basal contact and age and providing conclusions concerning its tectonic significance *The Tectonic Setting and Origin of Cretaceous Batholiths within the North American Cordillera* Robert S. Hildebrand, Joseph B. Whalen, 2017-10-03 In this Special Paper Hildebrand and Whalen present a big picture paradigm busting synthesis that examines the tectonic setting temporal relations and geochemistry of many plutons within Cretaceous batholithic terranes of the North American Cordillera In addition to their compelling tectonic synthesis they argue that most of the batholiths are not products of arc magmatism as commonly believed but instead were formed by slab failure during and after collision They show that slab window and Precambrian TTG suites share many geochemical similarities with Cretaceous slab failure rocks Geochemical and isotopic data indicate that the slab failure magmas were derived dominantly from the mantle and thus have been one of the largest contributors to growth of continental crust The authors also note that slab failure plutons emplaced into the epizone are commonly associated with Cu Au porphyries as well as Li Cs Ta pegmatites Tectonic Setting and Gondwana Basin Architecture in the Indian Shield Subhrangsu Acharyya, 2018-12-04 Tectonic Setting and Gondwana Basin Architecture in the Indian Shield Volume Four is the newest book in the Problems and Solutions in Structural Geology and Tectonics series from Elsevier and is a synthesized monograph on the tectonic settings of Gondwana basins of India It is a unique book on a topic of national and international interest especially given the economic importance of the region coal reserves The book is authored and edited by very experienced theoretical experts and explores and reconstructs unified stratigraphic research of the region including the relative role of tension and lateral movement in basin formation Basin formation is the driving force behind formation and break up of supercontinents and the time frame of supercontinent cycles Provides the latest data on the tectonic settings of Gondwana basins of India Explores the unified stratigraphic research of the region Authored and edited by experienced theoretical experts **The Field Description of Metamorphic Rocks** Dougal Jerram, Mark Caddick, 2022-03-01 The Field Description of Metamorphic Rocks The Field Description of Metamorphic Rocks Second Edition This pocket sized field guide describes how metamorphic rocks and rock masses may be observed recorded and mapped in the field Written at a level

suitable for Earth Science undergraduate students this book is an essential tool for any geologist student professional or amateur faced with the task of making a general description of an area of metamorphic rocks A clear systematic framework together with numerous colour diagrams illustrations and checklists enables readers with different backgrounds to produce useful descriptions despite possible differences of background or specialist interest Additional information is also provided to aid those who are undertaking field mapping courses or must compile field evidence into reports on the metamorphic evolution of a region This book Shows the reader how to observe metamorphic rocks in the field from the outcrop to the hand specimen scale Is fully revised and updated to incorporate new developments in the field Offers a user friendly and accessible writing style including a revised format with tabbed sections for easy navigation Covers key topics including classification and mapping of metamorphic rocks understanding key textures and fabrics and details on contacts and fault zones

Tectonic Setting of Faulted Tertiary Strata Associated with the Catalina Core Complex in Southern Arizona William R. Dickinson,1991

Mid Tertiary strata exposed as tilted homoclines along the flanks of the San Pedro trough and across broad uplands north of the Catalina core complex are assigned to the following formations each of which includes informal local members and facies a Mineta Formation mid Oligocene redbeds including both conglomeratic fluvial and finer grained lacustrine deposits b Galiuro Volcanics including lavas and domes air fall and ash flow tuffs and intercalated volcanoclastic strata of late Oligocene to earliest Miocene age c Cloudburst Formation also of late Oligocene and earliest Miocene age but including a sedimentary upper member of conglomeratic strata as well as a volcanic lower member correlative with part of the Galiuro Volcanics and d San Manuel Formation composed of lower Miocene alluvial fan and braidplain deposits that display contrasting clast assemblages in different areas of exposure Generally correlative Oligocene Miocene strata exposed south of the Catalina core complex are assigned to the Pantano Formation which contains similar lithologic components Less deformed Neogene strata of post mid Miocene basin fill are assigned to the Quiburis Formation along the San Pedro trough but stratigraphic equivalents elsewhere lack adequate nomenclature High benchlands mantled by paleosols mark the highest levels of Neogene aggradation Successive stages of subsequent erosional dissection are recorded by multiple terrace levels incised into basin fill Key exposures of syntectonic mid Tertiary sedimentary sequences in several local subareas reveal typical structural and stratigraphic relationships Multiple fault blocks expose pre Tertiary bedrock overlain by tilted mid Tertiary strata confined to intervening half grabens Bounding syndepositional faults dip southwest and associated homoclines dip northeast Fanning dips and buttress unconformities reflect progressive tilt and burial of eroding fault blocks Dips of block bounding faults are inversely proportional to the ages of the faults Steeper dips for younger faults suggest either progressive erosion of

successive listric faults or progressive rotation of successive planar faults Uniformly moderate to steep dihedral angles between fault surfaces and offset homoclinal bedding imply that the faults dipped more steeply near the surface when syntectonic mid Tertiary strata were subhorizontal Although the inference of listric faulting best links apparent strands of the Catalina detachment system the alternate interpretation of rotational normal faulting is compatible with local structural relationships including tilt of porphyry copper orebodies Within the San Pedro trough multiple homo clines of mid Tertiary strata are exposed locally in tilt blocks exhumed by Neogene erosion from beneath nearly flat lying basin fill of the Quiburis Formation Faults bounding the mid Tertiary exposures include backtilted strands of the Catalina detachment system somewhat younger listric or rotational normal faults and steeper basin range normal faults that display offsets both synthetic and antithetic to the flanks of the San Pedro trough In Cienega Gap flanking the Tucson Basin multiple tilt blocks of the Pantano Formation form part of the upper plate of the Catalina detachment system Initial construction of alluvial fans by generally westward paleoflow was followed by ponding of lacustrine environments along the foot of secondary breakaway scarps that also generated massive megabreccia deposits In summary syntectonic Oligocene to Miocene sedimentation succeeded a prominent pulse of polymodal mid Tertiary volcanism and was coeval with mylonitic deformation and detachment faulting along the flank of the Catalina core complex The headwall rupture for the detachment system migrated westward from an initial position along the range front of the Galiuro Mountains After mid Miocene time accumulation and subsequent dissection of essentially undeformed basin fill was accompanied by basin range block faulting The most challenging structural issue is whether fault strands of the Catalina detachment system are interconnected or are disconnected rotational segments
