The Origin Of Stars And Planetary Systems:

The Origin of Stars and Planetary Systems Charles J. Lada, N.D. Kylafis, 2012-12-06 A few years after the publication of *The Physics of Star Formation and Early Stellar Evolution* we received a request from the publisher for an up dated second edition of this popular reference book As originally intended the volume had proved to be a useful text book for graduate astronomy courses and seminars which dealt with topics related to stellar origins The book was based on a series of lectures delivered by a distinguished group of leading researchers at a NATO Advanced Study Institute ASI held in May 1990 on the island of Crete Greece The primary goal of the ASI was in fact to produce a book which would simultaneously provide a broad and systematic overview of as well as a rigorous introduction to the fundamental physics and astronomy at the heart of modern research in star formation and early stellar evolution However by 1995 concern had arisen among those who used the text as a reference for graduate seminars and courses that the book would need to be updated to stay abreast of the discoveries and progress in this rapidly evolving field After some discussion we concluded that a new edition of the book was warranted and that the goal of producing a new edition would be best accomplished by organizing a second ASI in Crete to review the progress in star formation research

Strategy for the Detection and Study of Other Planetary Systems and Extrasolar Planetary Materials National Research Council, Division on Engineering and Physical Sciences, Space Studies Board, Committee on Planetary and Lunar Exploration, 1990-02-01 This volume addresses a new opportunity in the planetary sciences to extend our exploration outward to discover and study planetary systems that may have formed or are forming around other stars It concludes that a coordinated program of astronomical observation laboratory research theoretical development and understanding of the dynamics and origins of whatever may be found would be a technologically feasible and potentially richly rewarding extension of the study of bodies within the solar system

Cosmochemical Evolution and the Origins of Life J. Oró, S. L. Miller, C. Ponnampereuma, R. S. Young, 2013-04-17 This publication in two volumes includes most of the scientific papers presented at the first meeting of the International Society for the Study of the Origin of Life ISSOL held on June 25 28 1973 in Barcelona Spain The first volume contains the invited articles and the second volume the contributed papers which also appear in the 1974 and 1975 issues respectively of the new journal *Origins of Life* published by D Reidel A relatively large number of meetings on the subject of the origin of life have been held in different places since 1957 In terms of its organization scope and number and nationality of participants the Conference celebrated last year in Barcelona closely followed the three international conferences held earlier in Moscow U S S R 1957 Wakulla Springs U S A 1963 and Pont a Mousson France 1970 For this reason the first ISSOL meeting was also named the 4th International Conference on the Origin of Life

The Genetic Code and the Origin of Life Lluís Ribas de Pouplana,2007-04-03 Early Thoughts on RNA and the Origin of Life The full impact of the essential role of the nucleic acids in biological systems was forcefully demonstrated by the research community in the 1950s Although Avery and his collaborators had identified DNA as the genetic material responsible for the transformation of bacteria in 1944 it was not until the early 1950s that the Hershey Chase experiments provided a more direct demonstration of this role Finally the structural DNA double helix proposed by Watson and Crick in 1953 clearly created a structural framework for the role of DNA as both information carrier and as a molecule that could undergo the necessary replication needed for daughter cells Research continued by Kornberg and his colleagues in the mid 1950s emphasized the biochemistry and enzymology of DNA replication At the same time there was a growing interest in the role of RNA The 1956 discovery by David Davies and myself showed that polyadenylic acid and polyuridylic acid could form a double helical RNA molecule but that it differed somewhat from DNA A large number of experiments were subsequently carried out with synthetic polyribonucleotides which illustrated that RNA could form even more complicated helical structures in which the specificity of hydrogen bonding was the key element in determining the molecular conformation Finally in 1960 I could show that it was possible to make a hybrid helix

Prebiotic Chemistry and Life's Origin Michele Fiore, 2022-06-29 How life originated from the inanimate mixture of organic and inorganic compounds on the primordial earth remains one of the great unknowns in science This origin of life or abiogenesis continues to be examined in the context of the conditions and materials required for natural life to have begun on Earth both theoretically and experimentally This book provides a broad but in depth analysis of the latest discoveries in prebiotic chemistry from the microscopic to the macroscopic scale utilising experimental insight to provide a bottom up approach to plausibly explaining how life arose With contributions from global leaders this book is an ideal reference for postgraduate students and a single source of comprehensive information on the latest technical and theoretical advancements for researchers in a variety of fields from astrochemistry and astrophysics to organic chemistry and evolution

Planetary Systems: Formation, Evolution, and Detection Bernard F. Burke, Jürgen H. Rahe, Elizabeth E. Roettger, 2012-12-06 Are there other planetary systems like ours Other planets like ours Is there life elsewhere in the Universe So asks Dr Lew Allen Jr in the Foreword In December of 1992 theorists observers and instrument builders gathered at the California Institute of Technology to discuss the search for answers to these questions The International Conference entitled Planetary Systems Formation Evolution and Detection and supported through NASA's newly formed TOPS Toward Other Planetary Systems program was the first of a series of conferences uniting researchers across disciplines and political boundaries to share thoughts and information on planetary systems The conference was sponsored by NASA hosted by JPL at Caltech and endorsed by the 1992 International Space Year Association These proceedings include discussions of topics ranging from stellar disk and planetary formation to new ways of searching for other stellar systems containing planets The authors represent a wide range of nationalities disciplines and points of view The second international conference took place in December of 1993

Planetary Systems Marc Ollivier,Thérèse Encrenaz,Francoise Roques,Franck Selsis,Fabienne Casoli,2008-11-27 Over the past ten years the discovery of extrasolar planets has opened a new field of astronomy and this area of research is rapidly growing from both the observational and theoretical point of view The presence of many giant exoplanets in the close vicinity of their star shows that these newly discovered planetary systems are very different from the solar system New theoretical models are being developed in order to understand their formation scenarios and new observational methods are being implemented to increase the sensitivity of exoplanet detections In the present book the authors address the question of planetary systems from all aspects Starting from the facts the detection of more than 300 extraterrestrial planets they first describe the various methods used for these discoveries and propose a synthetic analysis of their global properties They then consider the observations of young stars and circumstellar disks and address the case of the solar system as a specific example different from the newly discovered systems Then the study of planetary systems and of exoplanets is presented from a more theoretical point of view The book ends with an outlook to future astronomical projects and a description of the search for life on exoplanets This book addresses students and researchers who wish to better understand this newly expanding field of research

Evolution of Matter and Energy on a Cosmic and Planetary Scale M. Taube,2012-12-06 My intention in this book is to describe in simple language using a minimum of mathematics but a maximum of numerical values the most important developments of science dealing with matter and energy on cosmic and global scales In the conventional literature all of these findings are distributed among books and journals on physics astronomy chemistry geology biology energy engineering and the environmental sciences The main purpose here is to attempt to give a unified description of Nature from the elementary particles to the Universe as a whole This is used as a basis for analysing the future development of mankind The future evolution of the Universe galaxies stars and planets gives some hope for the destiny of mankind The problem of matter and energy flow on the Earth appears soluble even for the distant future There seems to be no reason why a long period of human development on this planet should not be possible The book has been prepared based on my lectures at the Warsaw University from 1959 to 1968 and during the 15 years 1969-1983 at the Swiss Federal Institute of Technology Eidgenössische Technische Hochschule in Zurich and at the University of Zurich I wish to give my sincere thanks to the Swiss Federal Institute for Reactor Research at Würenlingen for their constant support I am especially grateful to Mrs

Christine Stratton for setting up the English text and to Mr R W Stratton and LG McKinley for their helpful criticisms and remarks

Vision and Voyages for Planetary Science in the Decade 2013-2022 National Research Council, Division on Engineering and Physical Sciences, Space Studies Board, Committee on the Planetary Science Decadal Survey, 2012-01-30 In recent years planetary science has seen a tremendous growth in new knowledge Deposits of water ice exist at the Moon's poles Discoveries on the surface of Mars point to an early warm wet climate and perhaps conditions under which life could have emerged Liquid methane rain falls on Saturn's moon Titan creating rivers lakes and geologic landscapes with uncanny resemblances to Earth's Vision and Voyages for Planetary Science in the Decade 2013 2022 surveys the current state of knowledge of the solar system and recommends a suite of planetary science flagship missions for the decade 2013 2022 that could provide a steady stream of important new discoveries about the solar system Research priorities defined in the report were selected through a rigorous review that included input from five expert panels NASA's highest priority large mission should be the Mars Astrobiology Explorer Cacher MAX C a mission to Mars that could help determine whether the planet ever supported life and could also help answer questions about its geologic and climatic history Other projects should include a mission to Jupiter's icy moon Europa and its subsurface ocean and the Uranus Orbiter and Probe mission to investigate that planet's interior structure atmosphere and composition For medium size missions Vision and Voyages for Planetary Science in the Decade 2013 2022 recommends that NASA select two new missions to be included in its New Frontiers program which explores the solar system with frequent mid size spacecraft missions If NASA cannot stay within budget for any of these proposed flagship projects it should focus on smaller less expensive missions first Vision and Voyages for Planetary Science in the Decade 2013 2022 suggests

that the National Science Foundation expand its funding for existing laboratories and establish new facilities as needed It also recommends that the program enlist the participation of international partners This report is a vital resource for government agencies supporting space science the planetary science community and the public Origins Steve Eales, 2007-03-12 In the last decade there has been a revolution in observational astronomy which has meant that we are very close to answering three of the four big origin questions of how the planets stars galaxies and the universe itself were formed As recently as 1995 we knew of only one planetary system our own Now we know of over a hundred and this knowledge has helped to reveal how planetary systems form In this same decade new types of telescope have allowed us to penetrate through clouds of interstellar dust to see the first moments in the life of a star and also to see directly not infer what galaxies looked like thirteen billion years ago only a billion years after the Big Bang Because of this new knowledge we now have provisional answers to the second and third origin question The final question is the one we can't yet answer but even here there have been big steps towards an answer Within the last four years astronomers have discovered that the universe is geometrically flat and that its expansion is accelerating fuelled by a mysterious dark energy This revolution in our observational knowledge of the universe including the first precise measurements of its age and matter and energy content has been vital groundwork for new ideas about its origin including the possibility that the universe originated in a larger meta universe Origin Questions describes at an understandable and basically non mathematical level the origin questions and the recent steps that have been taken towards answering them
