Handbook of Forensic Psychology William O'Donohue, Eric R. Levensky, 2004-01-19 Forensic psychology has mushroomed into a diverse and increasingly complex field that is equal parts law and psychology Psychologists act as expert witnesses in legal cases sometimes without knowing much about the laws involved and legal professionals rely on the

assessment of psychologists sometimes without knowing much about how such assessments are made. The purpose of this handbook is to provide professionals with current practical and empirically based information to guide their work in forensic settings or to better their understanding of the issues and debates in forensic psychology. Divided into four sections, the Handbook of Forensic Psychology covers basic issues, assessment, mental disorders, and forensic psychology and special topics. The basic issue chapters present a primer on law for the psychologist, a primer on psychology for attorneys, an overview of ethical issues relevant to forensic psychology, and a chapter on forensic report writing. The assessment section discusses factors and measures relevant for assessing a variety of behaviors, propensities, and capabilities, including dangerousness, violence, suicide, competency, substance abuse, PTSD, and neuropsychological evaluations, as well as discussing interviewing children and child custody evaluations. Additional chapters discuss eyewitness testimony, recovered memory, polygraphs, sexual harassment, juror selection, and issues of ethnicity in forensic psychology.

Neuropsychology Gerald Goldstein, Paul David Nussbaum, Sue R. Beers, 2013-06-29. In this volume of the series Human Brain Function: Assessment and Rehabilitation, we cover the area of how brain function is assessed with behavioral or neuropsychological instruments. These assessments are typically conducted by clinical neuropsychologists or behavioral neurologists, and so we made an effort to present the somewhat differing approaches to these two related disciplines. Clinical neuropsychologists are psychologists who typically utilize standardized tests, while behavioral neurologists are physicians who generally assess brain function as part of the clinical neurological evaluation. Both approaches have much to offer. The basic assumption of neuropsychological assessment is that the brain is the organ of behavior, and therefore the condition of the brain may be evaluated with behavioral measures. Neuropsychological tests are those measures found by research to be particularly sensitive to alterations in brain function. An adequate neuropsychological test is a procedure that can be related to some objective measure of alteration in brain function. Over the years, these objective measures have changed but generally involve documentation through direct observation of brain tissue or through histological, pathological, neuroimaging, or other laboratory procedures. The methods described in the first two volumes of this series describe the neuroimaging procedures that are often used in the validation of neuropsychological tests.
