Earth's Deep Water Cycle Steven D. Jacobsen, Suzan van der Lee, 2006-01-10 Published by the American Geophysical Union as part of the Geophysical Monograph Series Volume 168 The distribution of H<sub>2</sub>O in the Earth is under debate Although liquid water covers 70% of the surface the oceans represent only about 0.025% of the planet's mass far less water than thought to have been present during Earth's formation If our planet is missing most of its original water could it reside in the mantle Can we detect it seismically Recognition of the capacity of some deep mantle minerals to absorb water has propelled an interdisciplinary field of research addressing these two questions and more *Earth's Deep Water Cycle* advances the field with experimental modeling and seismic studies that focus

on the physical characteristics of hydrated minerals the potentially H<sub>2</sub>O rich transition zone 410 660 km depth and our detection abilities Integrated perspectives from four fields of research are featured Mineral physics and geochemistry Seismology and electrical conductivity Properties of deep hydrous mantle Global models and consequences of a deep Earth water cycle From experimental synthesis and physical properties measurements to geophysical observations and geodynamic modeling we are beginning to understand what parameters and data are needed to detect or refute the possibility of water in the deep Earth
