

ВВЕДЕНИЕ

Фотоконверсионные энергетические системы играют все более важную роль в современной структуре конверсионных систем преобразования энергии преобразованных источников энергии в мире [1]. Современная преобладающая фотоконверсионная система, она не имеет движущихся частей, не производит шума, не требует или почти не требует обслуживания, не требует турбулентного града, является экологически чистой, имеет модульную структуру и высокую надежность [2-4].

Анализ фотоконверсионных систем позволяет представить собой полный набор классификационных элементов для преобразования солнечного излучения в электричество и наоборот состоит из фотоконверсионного элемента, батареи, контроллеров заряда, инвертора и нагрузки системы [5]. Аналоговые системы – это фотоконверсионные энергетические, которые не включают в классификацию цепи [6].

Однако, чтобы иметь работу фотоконверсионной системы и иметь ее производительность в зависимости от климатических условий, необходимо представить ее функциональный блок как на основе фотоконверсионного элемента, на рис. 1 показана функциональная схема фотоконверсионной системы [7].

Рис.1 Структурная схема автономной фотоконверсионной системы

Fig. 1 The block diagram of an autonomous photovoltaic system

При наличии нагрузки может потребоваться преобразование мощности фотоконверсионной системы в определенное определенное напряжение, даже для солнечного излучения, температуры и окружающей среды. Необходимо разработать различные модели фотоконверсионных систем. Среди них самая простая модель с одним диодом. Это простой аналоговый вид простейшей и наиболее распространенной [8-10] как в классическом, так и в параллельном резонансе, чтобы показать влияние емкости и температуры на фотоконверсионный модуль [11]. Известно,

в зависимости от преобразователя мощности [12], найти максимальное напряжение тока (I) и напряжение (V) для модели с одним фотоконверсионным элементом и одним параллельным элементом и параллельным сопротивлением [13]. Прямой расчет характеристик нелинейной модели и нелинейности такого преобразователя обслуживания, как Matlab Simulink [14]. Это означает, что при наличии простого аналогового метода нелинейных параметров, является в уравнении нелинейного фотоконверсионного модуля. А представляет математическую модель фотоконверсионного элемента (PV) с использованием графа Matlab-simulink, для нелинейных параметров нелинейного уравнения, описывающего ток (I) и напряжение (V) [15]. Прямой простой и точный метод для прямого классического преобразования, неэффективен, так как нелинейность и неструктурированный преобразование в преобразованном элементе. Такой подход включает в себя математическую функцию и математическую модель [16]. Расчет нелинейной мощности тока и фотоконверсионной системы. Фактически, это соответствует условиям нелинейности нелинейных систем. Многие авторы представили фотоконверсионные системы и контроллеры тока нелинейной мощности (TMM) и сравнивают производительность, различия между TMM, который в настоящее время используется в солнечной фотоконверсионной системе, и представил новый метод TMM. Этот метод обеспечивает лучшее преобразование, вычисление систематического анализа преобразования и оценки ключевых элементов, для получения максимальной мощности солнечного элемента. При нелинейном нелинейном преобразовании нелинейной схемы [17]. В этой работе также рассмотрены структура нелинейности преобразования DC-DC и интеграция нелинейности преобразования DC-DC и фотоконверсионного модуля [18]. Нелинейный преобразователь, состоящий тока и параллельный резонанс и классификация с использованием Matlab. Выводы: в настоящее время преобразователи энергии и структуры преобразования в условиях рассматриваемой структуры и нелинейных нелинейных преобразованных элементов тока. Кроме того, выходы берутся из преобразователя, модель выходов фотоконверсионного модуля в качестве входа и тока.

Моделирование солнечных фотоконверсионных элементов и массивов

Чтобы создать модель солнечной фотоконверсионной (PV) ячейки, необходимо иметь модель нелинейной модели. Математическое выражение тока нагрузки можно получить из математической схемы солнечного фотоконверсионного элемента.
