Software Defined Radio Markus Dillinger, Kambiz Madani, Nancy Alonistioti, 2005-08-05 Software defined radio SDR is a hot topic in the telecommunications field with regard to wireless technology It is one of the most important topics of research in the area of mobile and personal communications SDR is viewed as the enabler of global roaming and a platform for the introduction of new technologies and services into existing live networks It therefore gives networks a greater flexibility into mobile communications It bridges the interdisciplinary gap in the field as SDR covers two areas of development namely software development and digital signal processing and the internet It extends well beyond the simple re configuration of air interface parameters to cover the whole system from the network to service creation and application development Reconfigurability entails the pervasive use of software reconfiguration empowering upgrades or patching of any element of the network and of the services and applications running on it It cuts across the types of bearer radio systems Paging to

cellular wireless local area network to microwave terrestrial to satellite personal communications to broadcasting enable the integration of many of today's disparate systems in the same hardware platform. Also, it cuts across generation second to third to fourth. This volume complements the already published volumes 1 and 2 of the Wiley Series in Software Radio. The book discusses the requirements for reconfigurability and then introduces network architectures and functions for reconfigurable terminals. Finally, it deals with reconfiguration in the network. The book also provides a comprehensive view on reconfigurability in three very active research projects as CAST, MOBIVAS, and TRUST/SCOUT. Key features include: Presents new research in wireless communications; Summarises the results of an extensive research program on software defined radios in Europe; Provides a comprehensive view on reconfigurability in three very active research projects as CAST, Configurable radio with Advanced Software Technology, MOBIVAS, Downloadable Mobile Value Added Services through Software Radio and Switching Integrated Platforms, TRUST, Transparently Reconfigurable Ubiquitous Terminal, and SCOUT, Smart User Centric Communication Environment.

Software Defined Radio Using MATLAB & Simulink and the RTL-SDR
 Robert W Stewart, Kenneth W Barlee, Dale S W Atkinson, 2015-09-11

The availability of the RTL SDR device for less than 20 brings software defined radio SDR to the home and work desktops of EE students, professional engineers, and the maker community. The RTL SDR can be used to acquire and sample RF radio frequency signals transmitted in the frequency range 25MHz to 1.75GHz, and the MATLAB and Simulink environment can be used to develop receivers using first principles DSP digital signal processing algorithms. Signals that the RTL SDR hardware can receive include FM radio, UHF band signals, ISM signals, GSM, 3G, and LTE mobile radio, GPS, and satellite signals, and any that the reader can legally transmit, of course. In this book, we introduce readers to SDR methods by viewing and analysing downconverted RF signals in the time and frequency domains, and then provide extensive DSP enabled SDR design exercises which the reader can learn from. The hands-on SDR design examples begin with simple AM and FM receivers and move on to the more challenging aspects of PHY layer DSP where receive filter chains, real-time channelisers, and advanced concepts such as carrier synchronisers, digital PLL designs, and QPSK timing and phase synchronisers are implemented. In the book, we will also show how the RTL SDR can be used with SDR transmitters to develop complete communication systems capable of transmitting payloads such as simple text strings, images, and audio across the lab desktop.

Many and ever more mobile users wish to enjoy a variety of multimedia services in very diverse geographical environments. The growing number of communication options within and across wireless standards is accommodating the growing volume and heterogeneity in wireless wishes. On the other hand, advancement in radio technologies opening much more flexibility, a.o. through Software Defined Radios, opens up the possibility to realize mobile devices featuring multi-mode options at low cost and interesting form factors. It is crucial to manage the new degrees of freedom opened up in radios and standards in a smart way such that the required service is offered at satisfactory quality as

efficiently as possible Efficiency in energy consumption is clearly primordial for battery powered mobile terminals specifically and in the context of growing ecological concerns in a broader context Moreover efficient usage of the spectrum is a growing prerequisite for wireless systems and coexistence of different standards puts overall throughput at risk The management of flexibility risks bringing about intolerable complexity and hamper the desired agility A systematic approach consisting of anticipative preparing for smooth operation allows mastering this challenge Case studies show that already today this approach enables smart operation of radios realizing impressive efficiency gains without hampering Quality of Service In the future wireless communication scenes will be able to profit from the opening of the spectrum Even smarter and cognitive behavior will become possible and essential
