**Semiconductor Power Electronics** Richard G. Hoft, 2012-12-06

Semiconductors have been used widely in signal level or brain applications Since their invention in 1948 transistors have revolutionized the electronics industry in computers information processing and communications Now however semiconductors are being used

more and more where considerable power is required. Devices such as high power bipolar junction transistors and power field effect transistors as well as SCRs, TRIACs, GTOs and other semiconductor switching devices that use a p-n-p-n regenerative effect to achieve bistable action are expanding the power handling horizons of semiconductors and finding increasing application in a wide range of products including regulated power supplies, lamp dimmers, motor drives, pulse modulators and heat controls. HVDC and electric vehicle propulsion are two additional areas of application which may have a very significant long range impact on the technology. The impact of solid state devices capable of handling appreciable power levels has yet to be fully realized. Since it first became available in late 1957, the SCR or silicon controlled rectifier, also called the reverse blocking triode thyristor, has become the most popular member of the thyristor family. At present SCRs are available from a large number of manufacturers in this country and abroad. SCR ratings range from less than one ampere to over three thousand amperes with voltage ratings in excess of three thousand volts.

### **Fundamentals of Power**

**Electronics** Erickson, 2013-06-29 In many university curricula the power electronics field has evolved beyond the status of comprising one or two special topics courses. Often there are several courses dealing with the power electronics field covering the topics of converters, motor drives and power devices with possibly additional advanced courses in these areas as well. There may also be more traditional power area courses in energy conversion machines and power systems. In the breadth vs depth tradeoff it no longer makes sense for one textbook to attempt to cover all of these courses; indeed each course should ideally employ a dedicated textbook. This text is intended for use in introductory power electronics courses on converters taught at the senior or first year graduate level. There is sufficient material for a one year course or at a faster pace with some material omitted for two quarters or one semester. The first class on converters has been called a way of enticing control and electronics students into the power area via the back door. The power electronics field is quite broad and includes fundamentals in the areas of Converter circuits and electronics, Control systems, Magnetics, Power applications, Design oriented analysis. This wide variety of areas is one of the things which makes the field so interesting and appealing to newcomers. This breadth also makes teaching the field a challenging undertaking because one cannot assume that all students enrolled in the class have solid prerequisite knowledge in so many areas.
