Optical Fibres and Sources for Communications M.J. Adams,I.D. Henning,2013-11-11

In the last few years the subject of optical communications has moved rapidly from being a promising research area to a practical reality already being installed and carrying traffic in trunk networks in many countries At the same time new applications for fibre technology are emerging and are placing new demands on the system components In telecommunications there is a steady increase of interest in the use of fibres for undersea cables in local area networks and wideband links and a little further ahead the possibility of coherent communications systems With an optical carrier bandwidth of 200 THz today s maximum bit rates of the order of Gb s l do not approach the limits of the medium and questions about the ultimate limits of optical communications are already being asked On a different front the rapid advance of fibre sensors previously drawing heavily on the communications technology is becoming a major driving force in the development of fibres and other components This picture of dramatic growth in optical technology gives rise to other phenomena A profusion of small companies mushrooms to meet the demands of specific market areas each such company formed around a nucleus of experienced personnel from the established research groups Multi nationals jostle for position in the optoelectronics marketplace and price wars develop as fibre costs fall University groups expand with government and industrial funding in attempts to maintain long term research options and produce trained personnel

New Developments in

Ferromagnetism Research V. N. Murray,2005 Ferromagnetism is a form of magnetism that can be acquired in an external magnetic field and usually retained in its absence so that ferromagnetic materials are used to make permanent magnets A ferromagnetic material may therefore be said to have a high magnetic permeability and susceptibility which depends upon temperature Examples are iron cobalt nickel and their alloys Ultimately ferromagnetism is caused by spinning electrons in the atoms of the material which act as tiny weak magnets They align parallel to each other within small regions of the material to form domains or areas of stronger magnetism In an unmagnetised material the domains are aligned at random so there is no overall magnetic effect If a magnetic field is applied to that material the domains align to point in the same direction producing a strong overall magnetic effect Permanent magnetism arises if the domains remain aligned after the external field is removed Ferromagnetic materials exhibit hysteresis In 2004 it was discovered that a certain allotrope of carbon nanofoam exhibited ferromagnetism The effect dissipates after a few hours at room temperature but lasts longer at cold temperatures The material is also a semiconductor It is thought that other similarly formed materials of boron and nitrogen may also be ferromagnetic This new book rings together leading research from throughout the world
