Elements of Survey Sampling R. Singh, Naurang Singh Mangat, 2013-03-09 Modern statistics consists of methods which help in drawing inferences about the population under consideration These populations may actually exist or could be generated by repeated experimentation The medium of drawing inferences about the population is the sample which is a subset of measurements selected from the population Each measurement in the sample is used for making inferences about the population The populations and also the methods of sample selection differ from one field of science to the other Social scientists use surveys to collect the sample information whereas the physical scientists employ the method of experimentation for obtaining this information This is because in social sciences the factors that cause variation in the measurements on the study variable for the population units can not be controlled whereas in physical sciences these factors can be controlled at least to some extent through proper experimental design Several excellent books on sampling theory are available in the market These books discuss the theory of sample surveys in great depth and detail and are suited to the postgraduate students majoring in statistics Research workers in the field of sampling methodology can also make use of these books However not many suitable books are available which can be used by the students and researchers in the fields of economics social sciences extension education agriculture medical sciences business management etc These students and workers usually conduct sample surveys during their research projects

**Sampling Theory and Practice** Changbao Wu, Mary E. Thompson, 2020-05-15. The three parts of this book on survey methodology combine an introduction to basic sampling theory, engaging presentation of topics that reflect current research trends, and informed discussion of the problems commonly encountered in survey practice. These related aspects of survey methodology rarely appear together under a single connected roof, making this book a unique combination of materials for teaching research and practice in survey sampling. Basic knowledge of probability theory and statistical inference is assumed, but no prior exposure to survey sampling is required. The first part focuses on the design-based approach to finite population sampling. It contains a rigorous coverage of basic sampling designs, related estimation theory, model-based prediction approach, and model-assisted estimation methods. The second part stems from original research conducted by the authors as well as important methodological advances in the field during the past three decades. Topics include calibration, weighting methods, regression analysis, and survey-weighted estimating equation (EE) theory, longitudinal surveys, and generalized estimating equations (GEE) analysis, variance estimation, and resampling techniques, empirical likelihood methods for complex surveys, handling missing data, and non-response, and Bayesian inference for survey data. The third part provides guidance and tools on practical aspects of large-scale surveys such as training and quality control, frame construction, choices of survey designs, strategies for reducing non-response, and weight calculation. These procedures are illustrated through real-world surveys. Several specialized topics are also discussed in detail, including household surveys, telephone and web surveys, natural resource inventory surveys, adaptive and network surveys, dual-frame and multiple-frame surveys, and analysis of non-probability survey samples. This book is a self-contained introduction to survey sampling that provides a strong theoretical base with coverage of current research trends and pragmatic guidance and tools for conducting surveys.
