Conn's Biological Stains Richard Horobin, John Kiernan, 2020-08-13 Published on behalf of the Biological Stain Commission For 75 years Conn's Biological Stains has been a standard reference for all those who used dyes and colorants in the biological and medical sciences This long awaited tenth edition appears 25 years after R D Lillie's ninth and has been completely rewritten to reflect the increase in range of uses Although the staining of microscopical preparations continues to expand the uses of dyes and fluorochromes now extend far beyond this traditional application This book provides the first critical overview of the whole range of low molecular weight fluorescent probes outside the catalogue literature The first ten chapters are essays by leading experts on the important aspects of colorants and their uses Most of the remainder of the book consists of descriptions by Dr Horobin of the properties and recent applications of hundreds of individual compounds in about twenty chemical classes The last chapter reviews the procedures employed at the Biological Stain Commission's laboratory to assay and test dyes and certify them as suitable for their intended applications

Physico-chemical Aspects of Textile Coloration Stephen M. Burkinshaw, 2016-02-08 The production of textile materials comprises a very large and complex global industry that utilises a

diverse range of fibre types and creates a variety of textile products As the great majority of such products are coloured predominantly using aqueous dyeing processes the coloration of textiles is a large scale global business in which complex procedures are used to apply different types of dye to the various types of textile material The development of such dyeing processes is the result of substantial research activity undertaken over many decades into the physico chemical aspects of dye adsorption and the establishment of dyeing theory which seeks to describe the mechanism by which dyes interact with textile fibres Physico Chemical Aspects of Textile Coloration provides a comprehensive treatment of the physical chemistry involved in the dyeing of the major types of natural man made and synthetic fibres with the principal types of dye The book covers fundamental aspects of the physical and chemical structure of both fibres and dyes together with the structure and properties of water in relation to dyeing dyeing as an area of study as well as the terminology employed in dyeing technology and science contemporary views of intermolecular forces and the nature of the interactions that can occur between dyes and fibres at a molecular level fundamental principles involved in dyeing theory as represented by the thermodynamics and kinetics of dye sorption detailed accounts of the mechanism of dyeing that applies to cotton and other cellulosic fibres polyester polyamide wool polyacrylonitrile and silk fibres non aqueous dyeing as represented by the use of air organic solvents and supercritical CO₂ fluid as alternatives to water as application medium The up to date text is supported by a large number of tables figures and illustrations as well as footnotes and widespread use of references to published work The book is essential reading for students teachers researchers and professionals involved in textile coloration

Light microscopic techniques in biology and medicine J. James, 2012-12-06 Up to about twenty five years ago virtually the entire field of microscopy could be overseen and even practiced by any active research worker The rapid evolution which microscopy in its broadest sense has since undergone and which has contributed greatly to our insight in many fields of biological science and medicine has however lead to a progressive specialisation Both experienced investigators in clinical and biological laboratories and post graduate students confronted with a limited number of microscopic techniques in their daily research work have increasing difficulty in keeping or obtaining a general idea of the many time honoured and new possibilities which microscopy has to offer This book has been written with the aim of presenting general information on light microscopic techniques at a level somewhere in between booklets like those provided by microscope manufacturers which are often too much focussed on the production program of a particular make and very advanced treatises with a thorough mathematical treatment of all phenomena concerned The physically oriented texts moreover often do not sufficiently take into account the practical situation in a medical or biological laboratory on the other hand the value of really understanding what one is doing in using a microscopic technique is often underestimated At tempt has been made therefore to present sufficient background information necessary for a rational application of the different microscopical techniques in their mutual relationship
