Development of an Ultrasonic Sensing Technique to Measure Lubricant Viscosity in Engine Journal Bearing In-Situ Michele Schirru, 2017-02-21 This thesis presents a novel ultrasonic instrument for non invasive and in situ characterization of journal bearing lubricant viscosity In particular the application to journal bearings is described by non invasively measuring the viscosity and localized power losses throughout operation This ultrasonic viscometer is based on the reflection of polarized shear waves from a thin resonating coating layer to increase the measurement sensitivity in comparison to conventional ultrasonic methods This instrument allows for a full engine oil viscoelastic characterization in situ The book investigates the effects of temperature pressure and shear rate and describes in detail the ultrasonic setup and method Further it demonstrates that the same technique can be applied similarly to monitor the lubrication of other engine components As such it offers a unique instrument that can drive the research of oil formulations to improve engine performance and fulfill the requirements of international fuel economy regulations
