USAF Formal Schools United States. Dept. of the Air Force, 1987      Systems Programming in Unix/Linux K.C. Wang, 2018-08-27

Covering all the essential components of Unix/Linux including process management, concurrent programming, timer and time service, file systems and network programming, this textbook emphasizes programming practice in the Unix/Linux environment. Systems Programming in Unix/Linux is intended as a textbook for systems programming courses in technically oriented Computer Science Engineering curricula that emphasize both theory and programming practice. The book contains many detailed working example programs with complete source code. It is also suitable for self study by advanced programmers and computer enthusiasts. Systems programming is an indispensable part of Computer Science Engineering education. After taking an introductory programming course, this book is meant to further knowledge by detailing how dynamic data structures are used in practice using programming exercises and programming projects on such topics as C structures, pointers, link lists and trees. This book provides a wide range of knowledge about computer system software and advanced programming skills, allowing readers to interface with operating system kernel, make efficient use of system resources and develop application software. It also prepares readers with the needed background to pursue advanced studies in Computer Science Engineering such as operating systems, embedded systems, database systems, data mining, artificial intelligence, computer networks, network security, distributed and parallel computing.

System Software And Software Systems: Execution Support Environment Daniela L. Rus, Teodor Rus, 1994-11-26

SYSTEM SOFTWARE AND SOFTWARE SYSTEMS Concepts and Methodology is intended to offer a systematic treatment of the theory and practice of designing and implementing system software. The two volumes systematically develop and apply the systems methodology for software development. For that, the concept of a system is analysed and various types of systems used in computer science are systematized into a concept of an ad hoc system that is suitable as a mechanism for software development. The kernel of this methodology consists of a systematic approach for ad hoc systems development: specification, implementation, validation. The hardware and the software of a computer system are specified as ad hoc systems. Examples from various architectures, languages and operating systems are provided as illustrations. Problems and their suggested solutions are provided at the end of each chapter. Further readings and a list of references conclude each chapter. These volumes are self-contained and may be used as textbooks for an introductory course on system software and for a course on operating system. However, a broad spectrum of professionals in computer science will benefit from it.
