Errors-in-Variables Methods in System Identification Torsten Söderström,2018-04-07 This book presents an overview of the different errors in variables EIV methods that can be used for system identification Readers will explore the properties of an EIV problem Such problems play an important role when the purpose is the determination of the physical laws that describe the process rather than the prediction or control of its future behaviour EIV problems typically occur when the purpose of the modelling is to get physical insight into a process Identifiability of the model parameters for EIV problems is a non trivial issue and sufficient conditions

for identifiability are given. The author covers various modelling aspects which taken together can find a solution including the characterization of noise properties extension to multivariable systems and continuous time models. The book finds solutions that are constituted of methods that are compatible with a set of noisy data which traditional approaches to solutions such as total least squares do not find. A number of identification methods for the EIV problem are presented. Each method is accompanied with a detailed analysis based on statistical theory and the relationship between the different methods is explained. A multitude of methods are covered including instrumental variables methods, methods based on bias compensation, covariance matching methods and prediction error and maximum likelihood methods. The book shows how many of the methods can be applied in either the time or the frequency domain and provides special methods adapted to the case of periodic excitation. It concludes with a chapter specifically devoted to practical aspects and user perspectives that will facilitate the transfer of the theoretical material to application in real systems.

Errors in Variables Methods in System Identification gives readers the possibility of recovering true system dynamics from noisy measurements while solving over determined systems of equations making it suitable for statisticians and mathematicians alike. The book also acts as a reference for researchers and computer engineers because of its detailed exploration of EIV problems.

System Identification Karel J. Keesman, 2011-05-16

System Identification shows the student reader how to approach the system identification problem in a systematic fashion. The process is divided into three basic steps: experimental design and data collection, model structure selection and parameter estimation, and model validation, each of which is the subject of one or more parts of the text. Following an introduction on system theory particularly in relation to model representation and model properties, the book contains four parts covering data based identification, non parametric methods for use when prior system knowledge is very limited, time invariant identification for systems with constant parameters, time varying systems identification primarily with recursive estimation techniques, and model validation methods. A fifth part composed of appendices covers the various aspects of the underlying mathematics needed to begin using the text. The book uses essentially semi physical or gray box modeling methods although data based transfer function system descriptions are also introduced. The approach is problem based rather than rigorously mathematical. The use of finite input output data is demonstrated for frequency and time domain identification in static dynamic linear nonlinear time invariant and time varying systems. Simple examples are used to show readers how to perform and emulate the identification steps involved in various control design methods with more complex illustrations derived from real physical chemical and biological applications being used to demonstrate the practical applicability of the methods described. End of chapter exercises for which a downloadable instructors Solutions Manual is available from [fill in URL](#) here will both help students to assimilate what they have learned and make the book suitable for self tuition by practitioners looking to brush up on modern techniques. Graduate and final year undergraduate students will find this text to be a practical and realistic course in system identification that can be used

for assessing the processes of a variety of engineering disciplines System Identification will help academic instructors teaching control related to give their students a good understanding of identification methods that can be used in the real world without the encumbrance of undue mathematical detail

System Identification and Control Design Yoan D. Landau, 1990 Optimized System Identification Jer-Nan Juang, 1999 In system identification one usually cares most about finding a model whose outputs are as close as possible to the true system outputs when the same input is applied to both However most system identification algorithms do not minimize this output error Often they minimize model equation error instead as in typical least squares fits using a finite difference model and it is seen here that this distinction is significant Here we develop a set of system

identification algorithms that minimize output error for multi input multi output and multi input single output systems This is done with sequential quadratic programming iterations on the nonlinear least squares problems with an eigendecomposition to handle indefinite second partials This optimization minimizes a nonlinear function of many variables and hence can converge to local minima To handle this problem we start the iterations from the OKID Observer Kalman Identification algorithm result Not only has OKID proved very effective in practice it minimizes an output error of an observer which has the property that as the data set gets large it converges to minimizing the criterion of interest here Hence it is a particularly good starting point for the nonlinear iterations here Examples show that the methods developed here eliminate the bias that is often observed using any system identification methods of either over estimating or under estimating the damping of vibration modes in lightly damped structures
