Lahita's Systemic Lupus Erythematosus Robert G. Lahita, 2021-07-23 Systemic lupus erythematosus SLE commonly called lupus is a chronic autoimmune disorder that can affect virtually any organ of the body In lupus the body's immune system which normally functions to protect against foreign invaders becomes hyperactive forming antibodies that attack normal tissues and organs including the skin joints kidneys brain heart lungs and blood Lupus is characterized by periods of illness called flares and periods of wellness or remission Because its symptoms come and go and mimic those of other diseases lupus is difficult to diagnose There is no single laboratory test that can definitively prove that a person has the complex illness To date lupus has no known cause or cure Early detection and treatment are the key to a better health outcome and can usually lessen the progression and severity of the disease Anti inflammatory drugs antimalarials and

steroids such as cortisone and others are often used to treat lupus Cytotoxic chemotherapies like those used in the treatment of cancer are also used to suppress the immune system in lupus patients A new edition of this established and well regarded reference combines basic science with clinical science to provide a translational medicine model Systemic Lupus Erythematosus Sixth Edition is a useful reference for specialists in the diagnosis and management of patients with SLE a tool for measurement of clinical activity for pharmaceutical development and basic research of the disease and a reference work for hospital libraries Completely updated revised and expanded with the most comprehensive and accessible reference on SLE for clinicians and scientists Full color presentation throughout the book Provides the latest information available on diagnosis and treatment Incorporates an international panel of authors who are experts in their fields with an emphasis on young cutting edge scientists and physicians

Systemic Lupus Erythematosus Josef S. Smolen, Christoph C. Zielinski, 2012-12-06 More than 140 years

ago lupus erythematosus LE was recognized as a disease entity by clinicians working in the field of dermatology which had only recently become an independent medical discipline Soon after cutaneous lupus was first reported it was realized that apart from the skin the disease could involve other organs and thus be systemic in nature The latter observations were first made by MORITZ KAPOSI 1 whose work has attracted renewed attention recently and who succeeded FERDINAND VON HEBRA to the chair of dermatology at the Medical Faculty in Vienna The early description of lupus erythematosus in both its cutaneous and systemic manifestations was thus intimately associated with Vienna and its Medical School The next phase in the study of lupus was characterized by an increase in knowledge of the type and extent of organ involvement The work by OSLER 2 LIBMANN and SACKS 3 and KLEMPERER 4 best represents these advances The increase in clinical knowledge of LE finally led to DUBOIS famous monograph 5 which was published at a time of renewed interest in SLE elicited by the description by HARGRAVES et al 6 of the LE cell phenomenon A more detailed analysis of this finding revealed that the disease was characterized by an abnormal immune response although its pathogenetic implications were still unclear

Systemic Lupus Erythematosus, 2012 Patients that present with a connective tissue disease are often a challenge to diagnose and treat A connective tissue disease is a disorder in which the tissues of the body consisting of the cells and the matrix which holds them together are disrupted This guide will describe several multi system conditions that result from the inflammatory and immune mediated disorder systemic lupus erythematosus and the related condition of Sjogren s syndrome These diseases affect various tissues of the body details of their management are discussed within including presentation investigation differential diagnosis and treatment These diseases are multifactorial conditions associated with a complex genetic predisposition and various not well understood environmental triggers that induce

inflammatory and immune mediated responses directed against components of the person's own body. As a result these diseases fall under the umbrella term known as the systemic autoimmune diseases. Patients with a systemic autoimmune connective tissue disease can present with clinical symptoms and signs in one or more often several systems of the body. Some of these diseases affect people of certain ages and gender more often than others including children but this guide will focus on the management of adult patients. These diseases are more common than is generally realized, cannot be cured, are associated with considerable morbidity and still cause significant mortality. Appropriate investigations are critical to making the correct diagnosis so that treatment can be tailored to the patient's condition. It is important not only to recognize and treat the current disease activity but also to prevent death and the development of chronic damage due to complications of the disease and the immuno suppressive drugs used to treat it. Principles of drug treatment are discussed but the final choice of drug and exact dosages to be used will depend on the details of the patient's condition and should be planned by a physician with relevant experience of these conditions and responsible for the management of the patient. Due to the variable severity of these diseases and their multisystem nature patients with an autoimmune connective tissue disease may present to general practitioners, general physicians or internal medicine specialists, obstetricians, intensive care or any medical or surgical specialist. The majority of patients with these conditions are cared for long term by dermatologists, rheumatologists and/or nephrologists as it is the skin, joints and kidneys that are most often involved. However it should be noted that many patients develop cardio respiratory or infectious complications including accelerated atherosclerosis due to the disease and/or its treatment. Multidisciplinary care is important and should involve the full range of allied health professionals as well as the relevant clinical specialists depending on the organs and systems involved.

Advanced Handbook of Systemic Lupus Erythematosus Laurent Arnaud, Ronald van Vollenhoven, 2017-09-10.
