

The Igf System

Claire M. Perks, Jeff M.P. Holly

The IGF System:

The IGF System Ron G. Rosenfeld, Charles T. Roberts, 2010-11-09 It has been over 40 years since the original report by Salmon and Daughaday demonstrating that the ability of GH to stimulate sulfation of cartilage was mediated by a sulfation factor. In the ensuing decades it has become apparent that this sulfation factor activity encompasses a complex system of ligands, IGFs, receptors and carrier proteins that are in turn responsible for a wide array of cellular actions. The IGF system has been demonstrated to be critically involved in both intrauterine and postnatal growth and to have important implications in cancer biology as well, owing to the ability of the IGFs to function in endocrine, paracrine and autocrine modes and given the wide distribution of IGFs in virtually every organ system. The contributions to The IGF System reflect the wide span of interest in the IGF system and its implications for normal and abnormal growth and metabolism. The chapters have been divided into four broad sections: I Molecular biology of the IGF system; II Biological actions of the IGFs; III IGF physiology; and IV Clinical aspects of the IGFs. We have made every effort to highlight the major contemporary themes in IGF biology but as is inevitable in such a fast-moving field, perspectives will continue to change as new information is accumulated.

IGF and Nutrition in Health and Disease M. Sue Houston, Jeffrey M. P. Holly, Eva L. Feldman, 2004-08-04 A benchmark review on how specific nutrients or adverse nutritional states impact the components of the IGF/Insulin-like Growth Factor system and affect human health and disease. The authors describe the fundamentals of the IGF system, explain its basic mechanisms of action, illuminate its essential role in physical development across the life span and highlight the link between normal and abnormal cellular growth resulting in tumor formation. They also fully examine the clinical aspects of nutrition and IGF from pre and postnatal development through old age in the maintenance of normal metabolism, bone and muscle health and their role in pathological states. Special attention is given to critical illness, diabetes, gastrointestinal diseases, kidney failure, endocrine dysfunctions, cardiovascular disease, neurological disorders and cancer as well as to their potential for IGF therapy.

IGF-I and IGF Binding Proteins Stefano Cianfarani, D. R. Clemmons, Martin O. Savage, 2005-01-01 The IGF system pervades the fields of development, linear and cellular growth and metabolism. Not only is the functional integrity of the IGF

system crucial for normal linear growth and metabolism it is also of fundamental importance for normal fetal development This book consists of a compilation of chapters based on presentations at a symposium entitled IGFs and IGFBPs Assessment and Therapeutic Benefit Highly qualified basic scientists and endocrinologists report new advances in the broad field of IGF physiology and pathophysiology related to clinical medicine New and topical areas of the IGF field are covered focussing particularly on clinically relevant topics related to growth pediatric and adult growth hormone deficiency metabolic disorders diabetes mellitus and neurology Molecular and developmental defects are discussed as are the contributions to clinical diagnosis and management of measurement of IGFs and IGFBPs The therapeutic potential of recombinant human IGFs and IGFBPs in a range of disorders is also covered The present volume of Endocrine Development will be of particular interest to scientists and clinicians working in IGF and IGF related fields and to clinicians working in both pediatric and adult endocrinology and metabolism

Insulin-like Growth Factor Receptor Signalling Derek Leroith, Walter Zumkeller, Robert C. Baxter, 2003-07-31 Insulin like growth factors are ubiquitously expressed and are crucial for growth and function of almost all cells Together with their binding proteins and receptors they form a widely studied biological system involving many proteins and characterized by complex interactions In addition to its significance in growth and development the insulin like growth factor system also has important roles in a wide variety of pathological states This has led to interest in the therapeutic potential of insulin like growth factors and their binding proteins as candidate drug targets This comprehensive book contains current information on both basic science and clinical aspects of IGFs and their regulatory proteins with emphasis on their relevance to cancer

The IGF System During Growth and Differentiation of the Mouse, 1999 **The IGF System During Growth and Differentiation of the Mouse** Marjolein van Kleffens, 1999 **Insulin-Like Growth Factors** Douglas Yee, 2004 Over the past five years there has been an explosion of targeted therapies for cancer treatment In most cases these therapies have been based on pre clinical data showing that specific molecules play an important role in regulating the malignant phenotype In breast cancer there is compelling rationale that such targeted strategies should be successful Targeting of estrogen receptor ER has proven to be a successful way to reduce breast cancer risk decrease the risk of death and recurrence in an adjuvant setting and remains the first choice of treatment for advanced disease With this success it is hoped that other molecular pathways could also be successfully exploited This publication reviews the role of the insulin like growth factors IGFs in breast cancer Over 100 years ago George Beatson made an intuitive leap connecting breast cancer therapy with ovarian function He removed the ovaries from a premenopausal woman with breast cancer he reasoned that ovarian function regulated normal mammary gland function therefore the ovaries may influence the malignant phenotype Other discussion included cover the function of IGF action in the normal mammary gland using mouse model systems where expression and function can be manipulated and the patterns of expression of the IGFs their binding proteins and their receptors in the normal gland

Insulin-Like Growth Factors in Health and Disease,

An Issue of Endocrinology and Metabolism Clinics Claire M. Perks, Jeff M.P. Holly, 2012-06-28 This issue of Endocrinology Clinics authored by experts worldwide provides essential updates about insulin like growth factors IGFs The physiology is examined including the latest in what we have learned from animal models as well as humans The issue also covers IGFs and IGF system in the following growth disorders adipogenesis and obesity muscle function and disease bone cancer cardiac function and disease normal and diseased kidney peripheral nervous systems gastrointestinal diseases diabetes and metabolism and IGF 1 central degenerative diseases Intercellular Communication in the Nervous System Robert Malenka, 2010-05-22 Intercellular communication is part of a complex system of communication that governs basic cellular activities and coordinates cell actions The ability of cells to perceive and correctly respond to their environment is the basis of growth and development tissue repair and immunity as well as normal tissue homeostasis Errors in cellular information processing are responsible for diseases such as cancer autoimmunity diabetes and neurological and psychiatric disorders There is substantial drug development concentrating on this and intercellular communication is the basis of much of neuropharmacology By understanding cell signaling diseases may be treated effectively and theoretically artificial tissues may be yielded Neurotransmitters receptors synaptic structure and organization gap junctions neurotrophic factors and neuropeptides are all explored in this volume as are the ways in which signaling controls neuroendocrinology neuroimmunology and neuropharmacology Intercellular Communication in the Nervous System provides a valuable desk reference for all scientists who consider signaling Chapters offer impressive scope with topics addressing neurotransmitters receptors synaptic structure and organization neuropeptides gap junctions neuropharmacology and more Richly illustrated in full color with over 200 figures Contributors represent the most outstanding scholarship in the field with each chapter providing fully vetted and reliable expert knowledge *Post-translational Modifications and Associations in the IGF System* Olgica Nedic, 2014-03 The incidence of cancer diabetes mellitus cardiovascular and some other diseases continues to increase and there are still no sufficiently successive healing and preventive strategies Insulin like growth factors IGFs play important roles during entire life and depending on the biochemical pathway in which they are involved they may be regarded as growth factors hormones or cytokines IGFs exert their functions after binding to specific receptors and their availability is regulated by IGF binding proteins Altered activity in the IGF signaling pathways is connected with diseases but data are controversial as both beneficial and harmful effects of IGFs were recorded Traditional approaches to study biochemical pathways mostly based on the synthesis and clearance rates are not sufficient Post translational protein modifications and associations with other biomolecules may represent an intermediate level of control which deserves more attention This book provides an overview of the post translational events which affect the IGF system offering experimental data to document structural and functional changes which as a final consequence have altered IGF activity **Breast Cancer** Jorge R. Pasqualini, 2008-04-11 Now in its second edition this bestselling title has been extensively revised and

expanded to include new topics on obesity and breast cancerinduction of anti hormone and anti growth factor resistance in breast cancerclinical implications of testosterone and breast cancerinsulin like growth factorsdiscussions on the biological genetic and molecu

radiotherapy and chemotherapy represents the classical strategy in glioma management The revised WHO 2016 classification now distinguishes the oligodendrogliomas with 1p19q codeletion and IDH mutation from the astrocytomas with or without IDH mutations thereby creating homogenous and pathologically distinct subgroups While the status of gene expression and mutations define components of GBM subtypes it was also found that response to therapies was different for each subtype suggesting that personalized treatment based on genomic alterations could lead to a more favorable outcome for this disease
