### Abstract

Aging is a complex phenomenon the cause of which is not fully understood, despite the plethora of theories proposed to explain it. As we age, changes in essentially all physiological functions, including immunity, are apparent. Immune responses decrease with aging, contributing to the increased incidence of different chronic diseases with an inflammatory component (sometimes referred to as 'inflamm-aging'). It is clear from many studies that human longevity may be influenced by these changes in the immune system, but how they proceed is not clearly determined. In this chapter, we will review the age-related changes in the immune response and assess the validity of the immune theory of aging (i.e. that these changes in immune response are the primary cause of aging). Many data in humans support the notion that age-associated immune dysfunction may at least in part explain the aging process. Explanatory power may be enhanced by combination with other theories such as the free radical theory. More longitudinal studies are needed to corroborate the immune theory of aging.

One of the most important questions in life is why we age and why it ends. Most of the living organisms on earth are subject to this universal phenomenon, although at grossly differing rates, and most of our knowledge originates from mammalian studies. Another universal phenomenon of life is that each organism must possess the means to protect itself from external and internal challenges to maintain its integrity, i.e. must possess an immune system, different as this may be in different organisms [1]. Powerful defenses must be carefully focused on the target to limit self-injury, as inevitably occurs to some degree during immune reactions (immunopathology). Does this mean that as well as contributing to longevity by protecting against disease, the immune system may damage healthy tissue and contribute to the ageing process,

*The Immunologic Theory of Aging* Roy L. Walford, 1969      **Handbook of Theories of Aging** Merrill Silverstein, Vern L. Bengtson, Vern L. Bengtson, PhD, Norella Putney, Daphna Gans, 2008-10-27 The field of gerontology has often been criticized for being data rich but theory poor The editors of this book address this issue by stressing the importance of theory in gerontology While the previous edition focused on multidisciplinary approaches to aging theory this new edition provides cross disciplinary integrative explanations of aging theory The contributors of this text have reached beyond traditional disciplinary boundaries to partner with researchers in adjacent fields in studying aging and age related phenomena This edition of the Handbook consists of 39 chapters written by 67 internationally recognized experts in the field of aging It is organized in seven sections reflecting the major theoretical developments in gerontology over the past 10 years Special Features Comprehensive coverage of aging theory focusing on the biological psychological and social aspects of aging A section dedicated to discussing how aging theory informs public policy A concluding chapter summarizing the major themes of aging and offering predictions about the future of theory development Required reading for graduate students and post doctoral fellows this textbook represents the current status of theoretical development in the study of aging      *General system theory of aging. Special role of the immune system* V. Dontsov, 2019-08-01 The monograph examines the general methodological problems of the aging main mechanisms as well as consideration of the fundamental possibilities and directions of influence on this process A special place is occupied by the use of system analysis consideration of integrative systems and the special role of the immune system namely that part of it which is not responsible for immune phenomena proper but regulates the interaction of proliferation of various cell populations in the body      **The Thymus in Health and Senescence** Nathan F. Cardarelli, 2019-07-17 First published in 1989 This text was written to provide a relatively broad comprehensive study of the thymus in health and disease including relationships to the endocrine system immune system and again      **Immunological Aspects of Neoplasia — The Role of the Thymus** Bela Bodey, Stuart E. Siegel, Hans E. Kaiser, 2006-04-11 Our work began where the greatest classical morphologists left off their best work was the start of ours As our work progressed the rigidity of basic previous embryological principles was broken down as scientific knowledge advanced At the same time the molecular biological characterization of the cell surface receptor systems progressed enormously with the invention of NUMEROUS monoclonal antibodies Thus thymology became once again very important because the thymus is the first and central organ of the human immunological system Then the question of immuno neuroendocrine regulation arose and has only been partially answered Our book seeks to explore what has not been explored The topic of thymic epithelial cells is a unique one and has never been explored in any previous book as it is explored in this one Only a handful of great thymologists remain in the world today especially after the great loss the medical community suffered with the passing of Dr Good the list includes but is not limited to Dr Ritter and Dr Kendall in England Dr Savino in

Brazil Dr Dardenne in France Dr von Gaudecker in Germany a few others in Belgium and Holland and it is our hope that Dr Bodey is among them Nonetheless a book on the thymus has not been written in the last five years and a book such as this one has never been This book is based on a 30 year period of research and includes references from a broad range of sources spanning the globe and all sources even those that were the beginning of thymic research The book thus is uniquely well rounded more so that previous works     Immunology and Ageing N.
