Kleinbaum, 2008-08-01 **Survival Analysis** John P. Klein, Melvin L. Moeschberger, 2013-06-29 Applied statisticians in many fields must frequently analyze time to event data While the statistical tools presented in this book are applicable to data from medicine biology public health epidemiology engineering economics and demography the focus here is on applications of the techniques to biology and medicine The

analysis of survival experiments is complicated by issues of censoring where an individual's life length is known to occur only in a certain period of time and by truncation where individuals enter the study only if they survive a sufficient length of time or individuals are included in the study only if the event has occurred by a given date. The use of counting process methodology has allowed for substantial advances in the statistical theory to account for censoring and truncation in survival experiments. This book makes these complex methods more accessible to applied researchers without an advanced mathematical background. The authors present the essence of these techniques as well as classical techniques not based on counting processes and apply them to data. Practical suggestions for implementing the various methods are set off in a series of Practical Notes at the end of each section. Technical details of the derivation of the techniques are sketched in a series of Technical Notes. This book will be useful for investigators who need to analyze censored or truncated life time data and as a textbook for a graduate course in survival analysis. The prerequisite is a standard course in statistical methodology. This book offers an excellent course in survival analysis for

Maintenance Management of Wind Turbines Fausto Pedro García Márquez, 2020-12-06 Maintenance Management of Wind Turbines considers the main concepts and the state of the art as well as advances and case studies on this topic. Maintenance is a critical variable in industry in order to reach competitiveness. It is the most important variable together with operations in the wind energy industry. Therefore the correct management of corrective, predictive and preventive politics in any wind turbine is required. The content also considers original research works that focus on content that is complementary to other sub disciplines such as economics, finance, marketing, decision and risk analysis, engineering etc in the maintenance management of wind turbines. This book focuses on real case studies. These case studies concern topics such as failure detection and diagnosis, fault trees and subdisciplines e.g. FMECA, FMEA etc. Most of them link these topics with financial schedule resources, downtimes etc in order to increase productivity, profitability, maintainability, reliability, safety, availability and reduce costs and downtime etc in a wind turbine. Advances in mathematics, models, computational techniques, dynamic analysis etc are employed in analytics in maintenance management in this book. Finally the book considers computational techniques, dynamic analysis, probabilistic methods and mathematical optimization techniques that are expertly blended to support the analysis of multi criteria decision making problems with defined constraints and requirements.

Analyzing Ecological Data Alain Zuur, Elena N. Ieno, Graham M. Smith, 2007-08-29 Which test should I apply? During the many years of working with ecologists, biologists and other environmental scientists this is probably the question that the authors of this book hear the most often. The answer is always the same and along the lines of: What are your underlying questions? What do you want to show? The answers to these questions provide the starting point for a detailed discussion on the ecological background and purpose of the study. This then gives the basis for deciding on the most appropriate analytical approach. Therefore a better starting point for an ecologist is to avoid the phrase 'test' and think in terms of analysis. A test refers to something simple and unified that gives a

clear answer in the form of a p value something rarely appropriate for ecological data In practice one has to apply a data exploration check assumptions validate the models per haps apply a series of methods and most importantly interpret the results in terms of the underlying ecology and the ecological questions being investigated Ecology is a quantitative science trying to answer difficult questions about the complex world we live in Most ecologists are aware of these complexities but few are fully equipped with the statistical sophistication and understanding to deal with them

Design and Analysis of DNA Microarray Investigations Richard M. Simon, Edward L. Korn, Lisa M. McShane, Michael D. Radmacher, George W. Wright, Yingdong Zhao, 2006-05-09 DNA microarrays are an important technology for studying gene expression With a single hybridization the level of expression of thousands of genes or even an entire genome can be estimated for a sample of cells Consequently many laboratories are attempting to utilize DNA microarrays in their research

Whereas laboratories are well prepared to address the significant experimental challenges in obtaining reproducible data from this RNA based assay investigators are less prepared to analyze the large volumes of data produced by DNA microarrays Although many software packages have been developed for the analysis of DNA microarray data software alone is insufficient One needs knowledge about the various aspects of data analysis in order to select and utilize software effectively There is a plethora of analysis methods being published and it is difficult for biologists to determine which methods are valid and appropriate for their problems Many scientists have learned that software is not an adequate substitute for biostatistical knowledge and seek statistical collaborators Unfortunately there is presently a shortage of statisticians who are available and knowledgeable about DNA microarrays For statisticians to be effective collaborators in any area they must invest the time to understand the subject matter area and become familiar with the literature so that they can ask the right questions and identify the key issues Our objectives in this book are twofold to provide scientists with information about the design and analysis of studies using DNA microarrays that will enable them to plan and analyze their own studies or to work with statistical collaborators effectively and to aid statistical and computational scientists wishing to develop expertise in this area

Survival and Event History Analysis Odd Aalen, Ornulf Borgan, Hakon Gjessing, 2008-09-16 The aim of this book is to bridge the gap between standard textbook models and a range of models where the dynamic structure of the data manifests itself fully The common denominator of such models is stochastic processes The authors show how counting processes martingales and stochastic integrals fit very nicely with censored data Beginning with standard analyses such as Kaplan Meier plots and Cox regression the presentation progresses to the additive hazard model and recurrent event data Stochastic processes are also used as natural models for individual frailty they allow sensible interpretations of a number of surprising artifacts seen in population data The stochastic process framework is naturally connected to causality The authors show how dynamic path analyses can incorporate many modern causality ideas in a framework that takes the time aspect seriously To make the material accessible to the reader a large number of practical

examples mainly from medicine are developed in detail Stochastic processes are introduced in an intuitive and non technical manner The book is aimed at investigators who use event history methods and want a better understanding of the statistical concepts It is suitable as a textbook for graduate courses in statistics and biostatistics

Analysis of Multivariate Survival Data Philip Hougaard, 2012-12-06 Survival data or more general time to event data occur in many areas including medicine biology engineering economics and demography but previously standard methods have requested that all time variables are univariate and independent This book extends the field by allowing for multivariate times Applications where such data appear are survival of twins survival of married couples and families time to failure of right and left kidney for diabetic patients life history data with time to outbreak of disease complications and death recurrent episodes of diseases and cross over studies with time responses As the field is rather new the concepts and the possible types of data are described in detail and basic aspects of how dependence can appear in such data is discussed Four different approaches to the analysis of such data are presented The multi state models where a life history is described as the subject moving from state to state is the most classical approach The Markov models make up an important special case but it is also described how easily more general models are set up and analyzed Frailty models which are random effects models for survival data made a second approach extending from the most simple shared frailty models which are considered in detail to models with more complicated dependence structures over individuals or over time Marginal modelling has become a popular approach to evaluate the effect of explanatory factors in the presence of dependence but without having specified a statistical model for the dependence Finally the completely non parametric approach to bivariate censored survival data is described This book is aimed at investigators who need to analyze multivariate survival data but due to its focus on the concepts and the modelling aspects it is also useful for persons interested in such data but

The Statistics of Gene Mapping David Siegmund, Benjamin Yakir, 2007-05-27 This book details the statistical concepts used in gene mapping first in the experimental context of crosses of inbred lines and then in outbred populations primarily humans It presents elementary principles of probability and statistics which are implemented by computational tools based on the R programming language to simulate genetic experiments and evaluate statistical analyses Each chapter contains exercises both theoretical and computational some routine and others that are more challenging The R programming language is developed in the text
