Economics of Advanced Manufacturing Systems Hamid R. Parsaei, A. Mital, 2012-12-06 The 1980s have witnessed a tremendous growth in the field of computer integrated manufacturing systems The other major areas of development have been computer aided design computer aided manufacturing industrial robotics automated assembly cellular and modular material handling computer networking and office automation to name just a few These new technologies are generally capital intensive and do not conform to traditional cost structures The net result is a tremendous change in the way costs should be estimated and economic analyses performed The majority of existing engineering economy texts still profess application of traditional analysis methods But as was mentioned above it is clear that the basic trend in manufacturing industries is itself changing So it is quite obvious that the practice of traditional economic analysis methods should change too This book is an attempt to

address the various issues associated with non traditional methods for evaluation of advanced computer integrated technologies This volume consists of twenty refereed articles which are grouped into five parts Part one Economic Justification Methods consists of six articles In the first paper Soni et al present a new classification for economic justification methods for advanced automated manufacturing systems In the second Henghold and LeClair look at strengths and weaknesses of expert systems in general and more specifically an application aimed at investment justification in advanced technology The third paper by Carrasco and Lee proposes an enhanced economic methodology to improve the needs analysis conceptual design and detailed design activities associated with technology modernization

Group Technology E.A. Arn, 2012-12-06 Group Technology GT as a manufacturing concept has gained steady interest within the machine building industry all over the world Originally it was used more or less only in the so called parts family manufacturing concept With growing opportunities for using the computer in the design process operating planning and layout planning the potential advantages became more and more obvious In order to implement GT successfully and with a view to improving the overall economic situation of a production company it is necessary to consider all aspects of the complete manufacturing system Experience has shown that in the first stage a general basis has to be formed This is done by a clear and practical definition of three GT manufacturing systems the development of a set of classification systems for work pieces working operations and manufacturing equipment and in building a data bank from which a data basis for the GT planning process can be evaluated A second stage of implementation then considers the particular aspects of GT These are firstly a concept for layout and investment planning based on a representative parts spectrum secondly for application of the GT idea in the design process three similar types of parts are to be developed as a logical supplement to the standard and recurring parts practice thirdly a three stage process planning and work measurement system can be developed for the so defined spectrum of similar parts
