

Systematic Sampling

Systematic sampling is a type of probability sampling that selects items of data at regular intervals from a population.

$$\text{Sampling Interval} = \frac{\text{Population Size}}{\text{Sample Size}}$$

Sampling Method	Description	Example
Systematic Sampling	Every member in the population is given a number. After the first member is chosen, the remaining members are chosen from a given interval.	A list of people with their first names in alphabetical order are numbered. The 5th person is chosen randomly, followed by every subsequent 8th person.

Advantages	Disadvantages
- It is more time efficient than asking the entire population. - The sample can be selected proportional to the total population (stratified)	- Every member of the population must be listed. - The first member of the population must be chosen at random to avoid bias. - If a data entry is missing/empty, the entry is not included.

Systematic Data Collection:

Systematic Data Collection Susan C. Weller, A. Kimball Romney, 1988-02-01 Data collection in the field whether by interviewing or other methods can be carried out in a structured systematic and scientific way This volume compels field researchers to take very seriously not only what they hear but what they ask Ethnographers have often discovered too late that the value of their interview information is discounted as a consequence of poor sampling of both questions and informants and poor elicitation techniques The authors focus on the importance of establishing the right questions to ask through the use of free listing techniques then they describe in practical terms the administration of an impressive array of alternative kinds of informant task They conclude with a discussion of reliability and validity of various methods which can be used to generate more systematic culturally meaningful data *Selected Water Resources Abstracts*, 1990
