Huylenbroeck,2018-07-25 Ornamental plants are economically important worldwide Both growers and consumers ask continuously for new improved varieties Although there are numerous ornamental species ornamental plant breeding and plant breeding research is mainly limited to some major species This book focuses on the recent advances and achievements in ornamental plant breeding The first part of the book focuses on plant traits and breeding techniques that are typical for ornamental plants Eminent research groups write these general chapters For plant traits like flower colour or shape breeding for disease resistance and vase or shelf life are reviewed General technical plant breeding chapters deal with mutation breeding polyploidisation in vitro breeding techniques and new developments in molecular techniques The second part of the book consists of crop specific chapters Here all economically major ornamental species are handled together with selected representative species from different plant groups cut flowers pot plants woody ornamental plants In these crop specific chapters the main focus is on recent scientific achievements over the last decade **Monocots: Systematics and**

**Evolution** Karen L Wilson,David A Morrison,2000-05-19 Monocots Systematics and Evolution presents leading work from around the world on non grass monocotyledons and includes reviews and current research into their comparative biology phylogeny and classification The papers are based on presentations at the Second International Conference on the Comparative Biology of the Monocotyledons Monocots II held in Sydney Australia in late 1998 Many were subsequently updated or extended to take into account new information All 72 papers have been peer reviewed **Flowering Plants.**

**Monocotyledons** Klaus Kubitzki,2013-06-29 When Rolf Dahlgren and I embarked on preparing this book series Rolf took prime responsibility for monocotyledons which had interested him for a long time After finishing his comparative study and family classification of the mono cots he devoted much energy to the acquisition and editing of family treatments for the present series After his untimely death Peter Goldblatt who had worked with him continued to handle further incoming monocot manuscripts until in the early 1990s his other obligations no longer allowed him to continue At that time some 30 manuscripts in various states of perfection had accumulated which seemed to form a solid basis for a speedy completion of the FGVP monocots with the exception of the grasses and orchids which would appear in separate volumes I felt a strong obligation to do everything to help in publishing the manuscripts that had been put into our hands I finally decided to take charge of them personally although during my life as a botanist I had never seriously been interested in mono cots

Plants and human culture Naming plants Classification and the angiosperm phylogeny group *Diversity and Classification of Flowering Plants* Armen Leonovich Takhtadzhian, 1997 The culmination of more than fifty years of research by the foremost living expert on plant classification *Diversity and Classification of Flowering Plants* is an important contribution to the field of plant taxonomy In the last decade the system of classifying plants has been thoroughly revised Instead of describing every individual family Takhtajan includes descriptions in keys to families which he calls descriptive keys The advantage of descriptive keys is that they give both the characteristic features of the families and their differences The delimitation of families and orders drastically differs from the one accepted by the Englerian school and from the one accepted in Arthur Cronquist's system Takhtajan favors the smaller more natural families and orders which are more coherent and better defined where characters are easily grasped and which are more suitable for information retrieval and phylogenetic studies including cladistic analysis because it reduces polymorphic codings Flowering Plants Armen Takhtajan, 2009-07-06 Armen Takhtajan is among the greatest authorities in the world on the evolution of plants This book culminates almost sixty years of the scientist's research of the origin and classification of the flowering plants It presents a continuation of Dr Takhtajan's earlier publications including *Systema Magnoliophytorum* 1987 in Russian and *Diversity and Classification of Flowering Plants* 1997 in English In his latest book the author presents a concise and significantly revised system of plant classification Takhtajan system based on the most recent studies in plant morphology embryology phytochemistry cytology molecular biology and palynology Flowering plants are divided into two classes class Magnoliopsida or Dicotyledons includes 8 subclasses 126 orders c 440 families almost 10 500 genera and no less than 195 000 species and class Liliopsida or Monocotyledons includes 4 subclasses 31 orders 120 families more than 3 000 genera and about 65 000 species This book contains a detailed description of plant orders and descriptive keys to plant families providing characteristic features of the families and their differences **Reproductive Ecology of Tropical Forest Plants** K.S. Bawa, M. Hadley, 1991-01-15 *Reproductive Ecology of Tropical Forest Plants* reviews recent developments in the reproductive ecology of tropical forest plants and explores the implications of current findings on forest structure function management and conservation It examines how insights gained from reproductive ecology can be helpful in the management of tropical forest resources and discusses directions of future research **Flora of North America** Flora of North America Editorial Committee, 1993 *Flora of North America* Volume 22 is the first of five volumes covering monocots in North America north of Mexico The volume comprises many groups of aquatic plants and the North American relatives of groups that have their richest number of species in the New World tropics Included among the treatments are the rush family Junaceae which include important indicator species in wetland habitats the cat tails Typhaceae spiderworts Commelinaceae aroids Araceae and pondweeds Potamogetonaceae Thirty families are included in this volume representing a diverse range of plant forms from marine Zosteraceae eel grasses to stately Arecaceae palms and the naturalised exotic Zingiberaceae gingers

Heliconiaceae heliconias and Musaceae bananas      **The Anther** William G. D'Arcy, 1996-03-07 Publisher Description

**Secondary Pollen Presentation** P.F. Yeo, 2012-12-06 Secondary pollen presentation is presentation of pollen to vectors by structures other than anthers either passively or via a specialized protection and delivery system The main part of the book describes secondary pollen presentation genus by genus in 25 families The subject has never been extensively reviewed although secondary pollen presentation occurs in the largest family of flowering plants the Asteraceae Compositae and a large family of great economic importance the Leguminosae Now material from the scattered literature is brought together and supplemented with original observations Many species are illustrated and each family is individually discussed The last two chapters provide an overview of the whole topic All the main functions that secondary pollen presentation may perform can be carried out in other plants without it It is concluded from this that the evolution of secondary pollen presentation has been subject to constraint and canalization The floral biology of most plants with secondary pollen presentation has not been adequately studied Appendix 1 points to a wide range of topics on which research at various technical and academic levels is needed The book should also become a reference work for morphologists systematists and floral ecologists      *Frugivory and seed dispersal: ecological and evolutionary aspects* T.H. Fleming, Alejandro Estrada, 2012-12-06

Any scientific discipline needs a theoretical framework to guide its development and to sharpen the questions its researchers pursue In biology evolution is the grand theoretical framework and an historical perspective is necessary to understand present day biological conditions In its formative years the modern study of the fruit frugivore mutualism was guided by the specialist generalist paradigm developed by D Snow D McKey and H Howe Howe reviews the current status of this evolutionary paradigm and points out that it has been dismissed by many workers before being adequately tested This is because ecologists working with the tropical plants and frugivorous birds for which the paradigm was originally developed rarely measure the seed dispersal effectiveness of different disperser species He indicates that this paradigm still has heuristic value and suggests that several additional ecological paradigms including the concept of keystone species of plants and frugivores and the role that frugivores play in density dependent mortality in tropical trees are worth studying The concept of seed dispersal quality has been central to discussions of fruit frugivore coevolution Schupp thoroughly reviews data bearing on this concept constructs a hierarchical framework for viewing disperser effectiveness and points out that disperser effectiveness depends on both the quantity and quality of seed dispersal Effectiveness in turn affects both evolutionary and ecological relationships between dispersers and their food plants      **Seed Dispersal by Ants in a Deciduous Forest Ecosystem** Elena

Gorb, Stanislav S. N. Gorb, 2013-06-29 Countless ants transport and deposit seeds and thereby influence the survival, death and evolution of many plant species In higher plants seed dispersal by ants myrmecochory has appeared many times independently in different lineages More than 3000 plant species are known to utilize ant assistance to be planted Myrmecochory is a very interesting and rather enigmatic form of mutualistic ant plant associations This phenomenon is

extremely complex because there are hundreds of ant species connected with hundreds of plant species This book effectively combines a thorough approach to investigating morphological and physiological adaptations of plants with elegant field experiments on the behaviour of ants This monograph is a first attempt at collecting information about morphology ecology and phenology of ants and plants from one ecosystem The book gives readers a panoramic view of the hidden poorly known interrelations not only between pairs of ants and plant species but also between species communities in the ecosystem The authors have considered not just one aspect of animal plant relationships but have tried to show them in all their complexity Some aspects of the ant plant interactions described in the book may be of interest to botanists others to zoologists or ecologists but the entire work is an excellent example of the marriage of these biological disciplines **Costa Rican**

**Natural History** Daniel H. Janzen, 2018-12-14 This volume is a synthesis of existing knowledge about the flora and fauna of Costa Rica The major portion of the book consists of detailed accounts of agricultural species vegetation amphibians reptiles mammals birds and insects This is an extraordinary virtually unique work The tremendous amount of original previously unpublished firsthand information is remarkable Peter H Raven Director Missouri Botanical Garden An essential resource for anyone interested in tropical biology It can be used both as an encyclopedia a source of facts on specific organisms and as a source of ideas and generalizations about tropical ecology Alan P Smith Ecology *Plant Breeding Reviews, Volume 23* Jules

Janick, 2010-04-07 Plant Breeding Reviews is an open ended serial continuation series of review articles on research in plant genetics especially the breeding of commercially important crops This detailed analysis bridges the gap between the specialized researcher and the broader community of plant scientists **Darwin's Orchids** Retha Edens-Meier, Peter

Bernhardt, 2014-11-05 For biologists 2009 was an epochal year the bicentennial of Charles Darwin's birth and the 150th anniversary of the publication of a book now known simply as The Origin of Species But for many botanists Darwin's true legacy starts with the 1862 publication of another volume On the Various Contrivances by Which British and Foreign Orchids Are Fertilised by Insects and on the Good Effects of Intercrossing or Fertilisation of Orchids This slim but detailed book with the improbably long title was the first in a series of plant studies by Darwin that continues to serve as a global exemplar in the field of evolutionary botany In Darwin's Orchids an international group of orchid biologists unites to celebrate and explore the continuum that stretches from Darwin's groundbreaking orchid research to that of today Mirroring the structure of Fertilisation of Orchids Darwin's Orchids investigates flowers from Darwin's home in England through the southern hemisphere and on to North America and China as it seeks to address a set of questions first put forward by Darwin himself What pollinates this particular type of orchid How does its pollination mechanism work Will an orchid self pollinate or is an insect or other animal vector required And how has this orchid's lineage changed over time Diverse in their colors forms aromas and pollination schemes orchids have long been considered ideal models for the study of plant evolution and conservation Looking to the past present and future of botany Darwin's Orchids will be a vital addition to this tradition
