T Lymphocyte And Inflammatory Cell Research In Asthma:

T-Lymphocyte and Inflammatory Cell Research in Asthma G. Jolles, J. A. Karlsson, Jack H. Taylor, 2012-12-02 It is well established that asthma is an inflammatory disease of the airway mucosa and drugs like inhaled glucocorticoids are now commonly introduced early in therapy A characteristic feature of this disease is the vast number of eosinophils in airway tissue although many other migratory and resident inflammatory cells with the capacity to synthesize and release cytokines and putative asthma mediators are present in the inflamed mucosa The cross talk between lymphocytes and these cells and the role of cytokines in complex biological networks are currently areas of intense research This volume gathers together chapters and discussions on the biology of immunocompetent and inflammatory cells cellular interplay and communication and on the relative importance of cells and mediators in disease It should help contribute to further insights into the pathology of asthma and to the development of novel efficacious drugs for the treatment of asthma and related respiratory disorders *Targeting signalling pathways in inflammatory diseases* Uzma Saqib, Mirza S Baig, Chit Laa Poh, 2023-08-14

MHC Molecules: Expression, Assembly and Function Robert G. Urban, Roman M. Chicz, 2012-12-06 3 nanant expression systems have been used to make MHC molecules containing a single peptide of interest To date fifteen single peptide class I structures incorporating three different HLA and two different H 2 allotypes isotypes and four additional class II structures two single peptide complexes and two superantigen complexes have been reported These advances have enabled us to study the atomic detail of antigen presentation and the general mechanisms behind peptide binding and begin to construct models of T cell recognition Another area of research which has exploded over the past five years has been the identification of MHC associated peptides There are several methods one can use to determine the sequence identity of MHC restricted peptides Historically the most successful technique albeit crude and encumbered with serious limitations has been the use of overlapping synthetic peptides and T cell clones Unfortunately this method absolutely requires i knowledge of the target antigen ii availability of T cell clones and iii a relatively short overall length for the target source protein such that a set of overlapping peptides can be affordably synthesized Briefly the entire sequence of the target protein is chemically synthesized using overlapping peptides which are then screened for biological activity using standard T cell presentation assays Despite its limitations this method was used to identify the first immunodominant epitopes reported in the literature and continues to be used successfully today **New and Exploratory Therapeutic**
