The full moon is used to signify the passing of the months and year and has a variety of meanings across cultures. While “moon glow” — the light from the moon as it illuminates the evening — can sometimes be incredibly bright, it is simply the reflection of sunlight due to the position of the moon relative to the sun. As the moon orbits the Earth, it is positioned in a different spot in the night sky through the month, and the angle to the sun determines how much of the moon is illuminated (the “phase” of the moon). A full moon is when the moon is directly opposite from the sun, meaning that when the sun sets in the west, a full moon will rise in the east near to the same time. Interestingly, the moon orbits the Earth once every 27.3 days, but because the Earth is also moving around the sun, the time it takes for a full moon cycle is a little longer: 29.5 days.
