Social Costs Of Energy Consumption:

Social Costs of Energy Consumption Olav Hohmeyer, 2012-12-06 It has become apparent that the market diffusion of systems using new and renewable sources of energy such as solar systems wind energy converters etc is taking place more slowly than expected see e g Jochem et al 1986 p 338 This indicates that various barriers to the market introduction of such technologies have been underestimated This hypothesis is supported by the accelerating effect of strong financial incentives on market diffusion rates of wind energy systems in such countries as Denmark and the USA see Jochem et al 1986 p 340f It is often pointed out that the macroeconomic and social advantages of new energy technologies such as environmental attractiveness reduction of dependence on energy imports or resource preservation and the hidden costs of conventional energy systems are not adequately represented in microeconomic evaluations see Wicke 1986 p 12 or Solow 1982 p 32 The general market pricing mechanism does not seem to work adequately in such cases In any seriously distorted market government has to compensate by internalizing the external effects of economic processes see e g Solow 1982 p 31 or Osterkamp Schneider 1982 p 27 Therefore research efforts to estimate the full costs of energy systems to society are necessary The knowledge of these full social costs of energy could enable government to take corrective action to help the market mechanism achieve an optimal allocation of resources

Social Costs of Energy Olav Hohmeyer, Richard L. Ottinger, 2012-12-06 Although present day politics seems to be preoccupied with questions of economic growth and full employment the basic environmental problems stemming from the interactions of the economic sphere with global regional and local environments persist and will have an even greater impact in the future If economy and ecology are not reconciled in the years to come mankind will not have a sustainable future on Earth The typical negation of environmental problems in times of economic crisis is partially due to the fact that environmental and health damages of economic activities are neither priced nor included in our market price system This allows politicians to focus their attention on insufficient economic indicators which do not reflect the actual development of the welfare of society If economic lead indicators like GDP or balance of trade figures were better integrated with information on the environmental and health costs caused by the seemingly beneficial economic development politicians might have better guidance as to what policy choices would benefit society most

Important progress has been made in recent years in the valuation of social costs of energy and transport. This progress has encouraged the insight that systems of Green Accounting considering social costs and policy instruments for the internalization of social costs are necessary tools to realize the worldwide goal of sustainable development. This workshop report provides an excellent survey of the latest results of social costs in the energy and transport sector. Further, the theoretical framework of social costs is extended to a broader concept of sustainable development. Finally, concepts and first experiences of the internalization of social costs e.g. through least cost planning or an ecological tax reform are reviewed.

100% Clean, Renewable Energy and Storage for Everything Mark Z. Jacobson, 2020-10-01. Numerous laws including the Green New Deal have been proposed or passed in cities, states and countries to transition from fossil fuels to 100% clean renewable energy in order to address climate change, air pollution and energy insecurity. This textbook lays out the science, technology, economics, policy and social aspects of such transitions. It discusses the renewable electricity and heat generating technologies needed, the electricity, heat, cold and hydrogen storage technologies required, how to keep the electric power grid stable and how to address non-energy sources of emissions. It discusses the history of the 100% Movement which evolved from a collaboration among scientists, cultural leaders, business people and community leaders. Finally, it discusses current progress in transitioning to 100% renewables and the new policies needed to complete the transition. Online course supplements include lecture slides, answers to the end of chapter student exercises and a list of extra resources. **Review**

External Environmental Costs of Electric Power Olav Hohmeyer, Richard L. Ottinger, 2012-12-06. Environmental costs of electric power generation are receiving increasing attention as an important input to planning and decision processes. Since the outstart of the discussion on the monetized environmental costs of electricity in 1988, a number of studies have been conducted on the subject producing partially contradictory results. Simultaneously, political action has resulted from the first stage on this discussion process. In Germany, the higher rates which have to be paid to autoproducers based on renewable energy sources have been explicitly justified by the existence of external environmental costs of conventional electricity generation. At the same time

some state regulatory commissions in the United States have introduced adders for environmental costs in the utility planning process This book reports on the first international workshop on the subject bringing together practically all experts in the field of research and political implementation from the United States and Germany the two pioneering countries The more than thirty contributed papers contained in this volume give the most comprehensive and up to date overview of the field Some papers already outline the future course of research by giving an overview over some major research projects which have just started
