provides a record of the occasion of the St Petersburg IUPS symposium chaired by the editors of this volume and includes some added recent contributions from other leading international figures in the field Brought together under the sponsoring banner of the IUPS Commission for Somatosensory Physiology and Pain these scientists with their different experimental approaches seek collectively to understand the brain mechanisms that underlie our own nature and experience **Stevens'**

*System* Randall J. Nelson, 2001-11-13 Exploring new and past research in the understanding of how the brain deals with its own body image this book provides a review of pertinent literature and offers comprehensive descriptions of technical approaches The material includes new frameworks for the conceptualization of the system's representations scientific and clinical applications that stem from these approaches based on the new concepts and a discussion of tools used to study the interface of the brain and the body The book provides computational strategies for sensorimotor integration of the mammalian brain and includes algorithms for the design and implementation of haptic interfaces and tactile displacement

*Neural Aspects of Tactile Sensation* J.W. Morley, 1998-07-09 The world within reach is characterised to a large extent by our ability to sense objects through touch Research into the sensation of touch has a long history However it is only relatively recently that significant advances have been made in understanding how information about objects we touch is represented in both the peripheral and central divisions of the nervous systems This volume draws together the increasing body of knowledge regarding the mechanisms underlying tactile sensation and how they relate to tactile perception Individual chapters address the response of mechanoreceptors to stimuli including movement and shape the role of the somatosensory cortex in processing tactile information the psychophysics and neurophysiology of the detection and categorisation of somesthetic stimuli perceptual constancy recent findings in regard to short term and long term plasticity in the somatosensory cortex and the psychophysical correlates of this plasticity and parallel versus serial information processing in the cortex The authors look at past and current research and comment on the direction of future investigation relating findings from psychophysical studies of tactile behavior to our growing understanding of the underlying neural mechanisms

*Computational Models for Neuroscience* Robert Hecht-Nielsen, Thomas McKenna, 2012-12-06 Formal study of neuroscience broadly defined has been underway for millennia For example writing 2 350 years ago Aristotle asserted that association of which he defined three specific varieties lies at the center of human cognition Over the past two centuries the simultaneous rapid advancements of technology and consequently per capita economic output have fueled an exponentially increasing effort in neuroscience research Today thanks to the accumulated efforts of hundreds of thousands of scientists we possess an enormous body of knowledge about the mind and brain Unfortunately much of this knowledge is in the form of isolated factoids In terms of big picture understanding surprisingly little progress has been made since Aristotle In some arenas we have probably suffered negative progress because certain neuroscience and neurophilosophy precepts have clouded our self knowledge causing us to become largely oblivious to some of the most profound and fundamental aspects of our nature such as the highly distinctive propensity of all higher mammals to automatically segment all aspects of the world into distinct holistic objects and the massive reorganization of large portions of our brains that ensues when we encounter completely new environments and life situations At this epoch neuroscience is like a huge collection of small jagged jigsaw puzzle pieces piled in a mound in a large warehouse with neuroscientists going in and tossing more pieces onto the mound
