Synthesizing Synchronous Systems By Static Scheduling In Space Time:

Synthesizing Synchronous Systems by Static Scheduling in Space-Time Björn Lisper, 1989-05-10 The subject of this book is the synthesis of synchronous hardware The purpose is to provide a firm mathematical foundation for the so called space time mapping methods for hardware synthesis that have been proposed during the last few years Thus the treatment is fairly mathematical In a space time mapping method an algorithm is described as a set of atomic events with possible data dependencies between them The task is to find a mapping assigning a space time coordinate to each event so that causality is not violated and the solution is good Previous work in the area if it provided any formalism at all has relied mainly on uniform recurrence equations extensions thereof or on purely graph theoretic formulations In this project algebra is used instead and the close connection with single assignment languages is stressed Thus it is possible to generalize previous work and to give simple characterizations of the type of algorithms that can be implemented with space time mappings The results presented can be applied to hardware construction and compiler techniques for parallel computers *SYNTHESIZING*

SYNCHRONOUS SYSTEMS BY STATIC SCHEDULING IN SPACE-TIME Bjorn Lisper, 1989 **Mathematical Foundations Of Parallel Computing** V V Voevodin, 1992-03-24 Parallel implementation of algorithms involves many difficult problems In particular among them are round off analysis the way to convert sequential programs and algorithms into the parallel mode the choice of appropriate or optimal computer architect and so on To solve these problems it is necessary to know very well the structure of algorithms This book deal with the mathematical mechanism that permits us to investigate structures of both sequential and parallel algorithms This mechanism allows us to recognize and explain the relations between different methods of constructing parallel algorithms the methods of analysing round off errors the methods of optimizing memory traffic the methods of working out the fastest implementation for a given parallel computer and other methods attending the joint investigation of algorithms and computers *MFDBS 89* Janos Demetrovics, Bernhard Thalheim, 1989-05-30 This volume is a collection of the most important contributions presented at the second MFDBS conference held in Visegr d Hungary June 26 30 1989 The papers selected from more than one hundred submissions originating from 23 countries in 4 continents can be roughly divided into the following sections theoretical fundamentals of relational databases logical foundations and databases data modelling database design deductive databases transaction management and security concurrency control and distributed databases The volume reflects the current state of knowledge and is a guide to further development in database theory **PARLE '89 - Parallel Architectures and Languages Europe** Eddy Odijk, Martin Rem, 1989 Since the first PARLE conference PARLE 87 attracted more than 300 participants it was considered a useful and successful forum and encouraged the organization of this second issue known as PARLE 89 The initiative for these conferences was taken by project 415 of ESPRIT the European Strategic Programme for Research and Development in Information Technology of the Commission of the European Communities Their scope covers central themes in the area of

parallel architectures and languages including such topics as concurrent object oriented logic and functional programming MIMD dataflow inference and reduction machines design and verification of parallel systems VLSI WSI and RISC architectures performance evaluation memory management systolic arrays applications and special purpose architectures The four invited lectures present the state of the art and advanced developments in major research areas related to the topics of the conference Of the more than 150 submitted papers 45 were selected for presentation Furthermore the program of PARLE 89 comprises presentations on the subprojects which together constitute ESPRIT project 415 Parallel architectures based on a variety of programming styles object oriented logic functional dataflow are represented in these overviews

Logic at Botik '89 Albert R. Meyer, Michael A. Tait, 1989-06-07 The present volume contains the proceedings of Logic at Botik 89 a symposium on logical foundations of computer science organized by the Program Systems Institute of the USSR Academy of Sciences and held at Pereslavl Zalessky USSR July 3-8 1989 The scope of the symposium was very broad the topics of interest were complexity of formal systems constructive mathematics in computer science denotational and operational semantics of programs descriptive complexity dynamic and algorithmic logics and schematology formal tools to describe concurrent computations lambda calculus and related topics foundations of logic programming logical foundations of database theory logics for knowledge representation modal and temporal logics type theory in programming and verification of programs Thus the papers in this volume represent many interesting trends in logical foundations of Computer Science ranging from purely theoretical research to practical applications of theory Foundations of Data Organization and Algorithms Witold Litwin, 1989-06-07 The Third International Conference on Foundations of Data Organization and Algorithms has been organized by INRIA in Paris from June 21 to 23 1989 Previous FODO Conferences were held in Warsaw 1981 and in Kyoto 1985 The goal of this year's conference is to present advances in techniques of permanent and temporary data organization in different fields New applications such as image processing graphics geographic data processing robotics office automation information systems language translation and expert systems have developed various data organizations and algorithms specific to the application requirements The growing importance of these applications has created a need for general studies on data organization and algorithms as well as for specific studies on new database management systems and on filing services The articles submitted for the conference were subject to the usual rigorous reviewing process and selected on that basis They offer an excellent snapshot of the state of the art in the field and should prove invaluable for computer scientists faced by the problems of data organization which are raised by these new applications **Database Machines** Haran Boral, Pascal Faudemay, 1989 This volume contains 24 papers presented at the Sixth International Workshop on Database Machines The papers cover a wide spectrum of topics including system architectures storage structures associative memory architectures memory resident systems deduction and retrospectives on maturing projects The nature of the papers is highly technical and presumes knowledge of database management systems and familiarity with database machines The

book is representative of the dual trend in the field towards 1 search for new functionality and 2 attention to detail completeness and performance of prototype implementations

Mathematics of Program Construction Jan L.A. van de Snepscheut, 1989-06-07 The papers included in this volume were presented at the Conference on Mathematics of Program Construction held from June 26 to 30 1989 The conference was organized by the Department of Computing Science Groningen University The Netherlands at the occasion of the University's 375th anniversary The creative inspiration of the modern computer has led to the development of new mathematics the mathematics of program construction Initially concerned with the posterior verification of computer programs the mathematics have now matured to the point where they are actively being used for the discovery of elegant solutions to new programming problems Initially concerned specifically with imperative programming the application of mathematical methodologies is now established as an essential part of all programming paradigms functional logic and object oriented programming modularity and type structure etc Initially concerned with software only the mathematics are also finding fruit in hardware design so that the traditional boundaries between the two disciplines have become blurred The varieties of mathematics of program construction are wide ranging They include calculi for the specification of sequential and concurrent programs program transformation and analysis methodologies and formal inference systems for the construction and analysis of programs The mathematics of specification implementation and analysis have become indispensable tools for practical programming

Finite Representations of CCS and TCSP Programs by Automata and Petri Nets Dirk A. Taubner, 1989-08-09 This work relates different approaches for the modelling of parallel processes On the one hand there are the so called process algebras or abstract programming languages with Milner's Calculus of Communicating Systems CCS and the theoretical version of Hoare's Communicating Sequential Processes CSP as main representatives On the other hand there are machine models i.e. the classical finite state automata transition systems for which however more discriminating notions of equivalence than equality of languages are used and secondly there are differently powerful types of Petri nets namely safe and general place transition nets respectively and predicate transition nets Within a uniform framework the syntax and the operational semantics of CCS and TCSP are explained We consider both Milner's well known interleaving semantics which is based on infinite transition systems as well as the new distributed semantics introduced by Degano et al which is based on infinite safe nets The main part of this work contains three syntax driven constructions of transition systems safe nets and predicate transition nets respectively Each of them is accompanied by a proof of consistency Due to intrinsic limits which are also investigated here neither for transition systems and finite nets nor for general nets does a finite consistent representation of all CCS and TCSP programs exist However sublanguages which allow finite representations are discerned On the other hand the construction of predicate transition nets is possible for all CCS programs in which every choice and every recursive body starts sequentially
