Abstract

There are many problems in optical storage systems, including fault ride-through and disturbance, inadequate DC bus voltage support, and high state variable overshoot. The main problem is caused by the slow dynamic reaction speed of the energy storage system based on traditional PI control to the DC voltage of the optical storage system. A hybrid optical storage system control optimization strategy based on a DC virtual synchronous machines and improved model predictive control (MPC) was proposed in the paper as a solution to the aforementioned issues. A strategy based on DC virtual synchronous generator can improve the damping braces and overshoot suppression of DC voltage fluctuation during the disruption process of the energy storage system in the optical storage system. The dynamic response speed of energy storage in optical storage systems may be further increased based on the improved MPC. The effectiveness and validity of the control strategy proposed in the paper were verified by the simulation examples.

1. Introduction

The vigorous development of wind power, PV, and other new energy sources is an important way to establish a new power system and promote the realization of the "carbon peak and carbon neutralization" development goal[1]. However, the large-scale access of wind power and PV to the inverter interface emphasizes the power electronic characteristics of the power system, lowers the equivalent inertia of the system, and deteriorates the dynamic response to frequency [2-4]. Therefore, the successful realization of low voltage ride-through in a short period of time has become an essential criterion to measure grid connection [5]. In recent years, grid-connected inverters represented by virtual synchronous generators (VSG) have garnered more attention [6-8]. Grid-connected inverters can offer the necessary inertia and damping bracing for the system to alleviate the stability concerns caused by traditional grid-connected inverters by configuring energy storage or power standby.

There are several studies on PV grid-connected inverters. According to the literature [9], the inverter takes current instructions and adjusts them via the PR controller, and then uses the PI controller to adjust the phase between the grid-side voltage and the inverter voltage during the voltage sag. It is difficult to achieve, and the recovery process is slow. According to reference [10], VSG's transient power angle stability during the fault period was improved by adjusting the phase deviation between the VSG output voltage and the grid voltage during active command suppression faults. According to reference[11], grid voltage feedforward and active command regulation mode were adopted to prevent the VSG overcurrent phenomenon in the event of grid failure. According to Reference[12], proposes two current-limiting methods, fast current-limiting control and virtual impedance current-limiting control, which are used for near-end faults with severe fault degrees and far-end faults with mild fault degrees, respectively. According to reference [13], in
