Tcell Receptor Use In Human Autoimmune:

T-cell Receptor Use in Human Autoimmune Diseases Mark M. Davis, Joel Buxbaum, 1995 Animal models of some autoimmune diseases have indicated restricted T cell receptor use and have suggested therapies based on those data. Patients with naturally occurring diseases have not shown a consistent picture of receptor utilisation. This volume discusses the spectrum of T cell receptor use in human disease, the relationship between the human and animal findings and the biological and therapeutic implications of the former.

Immune Regulation and Immunotherapy in Autoimmune Disease Jingwu Zhang, 2007-01-25 This book critically reviews both clinical and immunological aspects of autoimmune disease with a strong emphasis on multiple sclerosis (MS). Research in MS is one of the fastest developing areas in modern medicine. It employs some of the newest concepts in autoimmune mechanisms and an array of new treatments that would have been considered science fiction only two decades ago. It is an area in which research findings are being actively translated into treatment strategies. Advances in this area have both clinical and scientific implications for other autoimmune conditions that share many similarities with MS. The book, which comprises 24 chapters contributed by experts and thought leaders in the field, is designed to provide new insights into two arenas: our current understanding of autoimmune mechanisms and immune regulation and the latest developments in immunotherapy. This book is intended for both researchers and clinicians. Its purpose is not only to provide a comprehensive review on the recent advances in the two arenas mentioned above but also to reflect the current opinions or concepts that influence our thinking about the disease mechanisms and our way of treating MS patients. Many of these issues have

emerged from recent studies and are somewhat contradictory to traditional thinking For example recent studies have indicated that MS is more heterogeneous in many aspects than traditionally thought Pathologically in addition to demyelination and inflammation there is axonal loss or damage detectable in the central nervous system CNS lesions

Anthony P. Weetman, 1991-12-19 **Current Concepts in Autoimmunity and Chronic Inflammation** Andreas Radbruch, Peter E. Lipsky, 2006-09-08 The immune system has been known to be capable of distinguishing self from non self since the pioneering work of Paul Ehrlich more than a century ago Originally described in experiments studying blood transfusion compatibility the principle of non autotoxicity is still valid although today the phenomenon is usually described in terms of tolerance or ignorance A great deal has been learned about the various processes preventing self reactivity normally These include processes that operate during immune cell ontogeny and subsequently on reactivity of mature lymphocytes in the periphery They encompass mechanisms that are intrinsic to potentially reactive lymphocytes and can result in central or peripheral deletion or the alteration of functional potential In addition there are influences that are extrinsic to potentially auto reactive lymphocytes including the function of regulatory cells differentiation state of antigen presenting cells availability of self antigen the cytokine and chemokine milieu as well as the trafficking patterns involved in generating productive immune interactions It is clear that the immune system devotes a considerable effort to the avoidance of the development of potentially pathogenic self reactivity Despite this the development of self reactivity is relatively common though the development of autoimmune disease is less frequent autoimmune diseases such as rheumatoid arthritis multiple sclerosis systemic lupus erythematosus psoriasis thyroiditis and myasthenia gravis are all too common and can cause

considerable morbidity and even mortality **Immunology of the Connective Tissue Diseases** G. S. Panayi, 2012-12-06

Connective tissue diseases demand study because of their frequency morbidity and mortality They present intriguing challenges in the fields of diagnosis management and research Their range has now expanded enormously so that no individual can master the whole subject particularly as this relates to their immunological basis Immunology of Connective Tissue Diseases has been written by experts who are either clinical or basic scientists The book presents up to date reviews of the immunological basis of connective tissue diseases as it impacts on diagnosis pathogenetic concepts disease monitoring and management The book is aimed at physicians interested in understanding the immunological basis of these diseases and at immunologists who are either entering this field for the first time and would like to have a convenient state of the art account of its status or who are researching in one area and would like to acquaint themselves with the developments which have taken place in others
