Snowball Earth:

Snowball Earth Gabrielle Walker, 2007-12-18 Did the Earth once undergo a super ice age one that froze the entire planet from the poles to the equator In *Snowball Earth* gifted writer Gabrielle Walker has crafted an intriguing global adventure story following maverick scientist Paul Hoffman's quest to prove a theory so audacious and profound that it is shaking the world of earth sciences to its core In lyrical prose that brings each remote and alluring locale vividly to life Walker takes us on a thrilling natural history expedition to witness firsthand the supporting evidence Hoffman has pieced together That evidence he argues shows that 700 million years ago the Earth did indeed freeze over completely becoming a giant snowball in the worst climatic catastrophe in history Even more startling is his assertion that instead of ending life on Earth this global deep freeze was the trigger for the Cambrian Explosion the hitherto unexplained moment in geological time when a glorious profusion of complex life forms first emerged from the primordial ooze In a story full of intellectual intrigue we follow the irascible but brilliant Hoffman and a supporting cast of intrepid geologists as they scour the planet uncovering clue after surprising clue We travel to a primeval lagoon at Shark Bay in western Australia where dolphins cavort with swimmers every morning at seven and living rocks sprout out of the water like broccoli heads to the desolate and forbidding ice fields of a tiny Arctic archipelago seven hundred miles north of Norway to the surprising fossil beds that decorate Newfoundland's foggy and windswept coastline and on to the superheated salt pans of California's Death Valley Through the contours of these rich and varied landscapes Walker teaches us to read the traces of geological time with expert eyes and we marvel at the stunning feats of resilience and renewal our remarkable planet is capable of *Snowball Earth* is science writing at its most gripping and enlightening

Ward, Donald Brownlee, 2007-05-08 In November 12 2002 Dr John Chambers of the NASA Ames Research Center gave a seminar to the Astrobiology Group at the University of Washington The audience of about 100 listened with rapt attention as Chambers described results from a computer study of how planetary systems form The goal of his research was to answer a deceptively simple question How often would newly forming planetary systems produce Earth like planets given a star the size of our own sun By Earth like Chambers meant a rocky planet with water on its surface orbiting within a star's habitable zone This not too hot and not too cold inner region relatively close to the star supports the presence of liquid water on a planet surface for hundreds of millions of years the time span probably necessary for the evolution of life To answer the question of just how many Earth like planets might be spawned in such a planetary system Chambers had spent thousands of hours running highly sophisticated modeling programs through arrays of powerful computers The results presented at the meeting were startling The simulations showed that rocky planets orbiting at the right distances from the central star are easily formed but they can end up with a wide range of water content Earth seems to be quite a gem a rocky planet where not only can liquid water exist for long periods of time but where water can be found as a healthy oceanful not too little and not too much Our planet seems to reside in a benign region of the Galaxy where comet and asteroid bombardment is tolerable and habitable zone planets can commonly grow to Earth size Such real estate in our galaxy perhaps in any galaxy is prime for life And rare as well Jonathan Cowie, 2013 The second edition of this acclaimed text has been fully updated and substantially expanded to include the considerable developments since publication of the first edition in our understanding of the science of climate change its impacts on biological and human systems and developments in climate policy Written in an accessible style it provides a broad review of past present and likely future climate change from the viewpoints of biology ecology human ecology and Earth system science It will again prove to be invaluable to a wide range of readers from students in the life sciences who need a brief overview of the basics of climate science to atmospheric science geography geoscience and environmental science students who need to understand the biological and human ecological implications of climate change It is also a valuable reference text for those involved in environmental monitoring conservation and policy making
