Diagnosis of Human Viruses by Polymerase Chain Reaction Technology Yechiel Becker,Gholamreza Darai,2012-12-06 The basis for the effective treatment and cure of a patient is the rapid diagnosis of the disease and its causative agent which is based on the analysis of the clinical symptoms coupled with laboratory tests Although rapid advance ments have been made in the laboratory diagnosis of virus diseases the neces sary isolation of the causative virus from the clinical specimens is a relatively long procedure Viruses which integrate into the cellular DNA such as human immunodeficiency virus HIV 1 or hepatitis B virus are difficult to identify by molecular techniques while viruses which exist in the clinical material in low concentrations are even more formidable to identify Recently the application of the polymerase chain reaction peR technique developed by K D Mullis and detailed in the study by Saiki et al 1985 led to a revolution in virus diagnosis The peR technique was rapidly applied to the diagnosis of viruses in clinical material Volume 1 of Frontiers of Virology provides new information on the advan tages of the use of the peR for the diagnosis of many human disease causing viruses as well as on some problems with its use **The Molecular Epidemiology of Human Viruses** Thomas Leitner,2012-12-06 Advances in DNA sequencing and phylogenetic inference have created powerful methods to investigate many dangerous human viruses The Molecular Epidemiology Of Viruses provides a comprehensive introduction to the use of genetic methods in molecular epidemiology and in depth examples of analyses from many viruses This book is of interest to researchers in the fields of infectious disease virology microbiology evolutionary biology epidemiology and molecular biology as well as anyone interested in tracking the spread of disease **Parliamentary Papers** Great Britain. Richt,Richard J. Webby,2014-07-08 From the first detailed clinical description of the disease in the Midwestern United States in 1918 to the isolation of the causative agent the first of any influenza virus in 1930 to its role in the genesis of the 2009 human pandemic swine have played a central role in the ecology of influenza Although not considered the major natural reservoir for influenza A viruses swine are host to a limited but dynamic assortment of viruses A number of subtypes

of influenza A viruses of human and avian origin including H1 H2 H3 H4 H5 H7 and H9 have been isolated from global swine populations Most of these isolations have however been limited in number and it is only H1 and H3 influenza viruses that are known to have formed stable lineages in swine In this respect swine influenza viruses SIV are similar to their counterparts in humans where H1 and H3 viruses have also been maintained The nature of these H1 and H3 viruses differ between the two host populations however and as discussed throughout this book are even different in swine populations in different geographic regions of the world due to multiple introductions of avian and human influenza viruses
