The Molecular Biology of Plant Development Harry Smith, Donald Grierson, 1982-01-01 Genetics, Development, and Evolution J. Perry Gustafson, G. Ledyard Stebbins, Francisco J. Ayala, 2013-04-17 One outstanding question in biology is the problem of development how the genetic instructions encoded in the DNA become expressed in the morphological physiological and behavioral features of multicellular organisms through an ordered sequence of events that extend from the first cell division of the zygote to the adult stage and eventual death The problem is how a one dimensional array of instructions is transformed into a four dimensional entity the organism that exists in space and time Understanding this transformation is nevertheless necessary for mastering the process of evolution One hundred and twenty five years after *The Origin of Species* we have gained some understanding of evolution at the genetic level Genetic information is stored in the linear sequence of nucleotides in the DNA Gene mutations chromosomal reorganizations and a host of related processes introduce variation in the sequence and the amount of DNA The fate of these variations is determined by interactions within

the genome and with the outside environment that are largely understood We have recently gained a glimpse of how the genome of eukaryotes is organized and will learn much more about it in the future now that we have the research tools for it

Current Topics in Developmental Biology ,1999-05-10 Current Topics in Developmental Biology Volume 45 surveys the major issues at the forefront of developmental biology This volume like others in the serial is valuable to researchers in the fields of animal and plant development and to students and other professionals who want an introduction to current topics in cellular and molecular approaches to developmental biology Chapters on the nervous system reproductive system and flowering introduce new models and concepts for understanding these processes Includes development of the nervous and reproductive systems Covers flowering in plants Highlights the roles of homeobox related transcription factors and growth factors in axis and organ development

Development of the Central Nervous System in Vertebrates S.C. Sharma,A.M. Goffinet,2012-12-06 the major theme of this book is the development of the vertebrate central nervous system this volume contains summaries of most of the invited participants at the NA advanced study institute entitled Development of central nervous system in vertebrates held in Maratea Italy from June 23 July 5 1991 In order to address this topic we have drawn upon a selection of current studies dealing with molecular cellular and system analysis which specifically pertain to the general principles of the development the major aim of this institute was to bring together a select group of investigators who would present their views on the current issues in their respective fields and to foster extensive discussions amongst participants in smaller groups Such interactions brought together the exchanges of ideas amongst participants and helped clarify the intricate details and formulate new vistas and collaborations Since the study of nervous system development has focused mostly on the origin of neuron and glia cells the area of current research was represented by talks on early cellular events including effects of growth factors *BOX* and other gene expressions and cell lineage of specific cell types Formation of specific cell types and the specific neuronal connections have been a major theme in the study of the nervous system development Recent technical advances have resulted in new information at both cellular and molecular levels which have provided new details Current research was represented by selective topics discussed at the meeting
