The Code Generators:

Construction and Evolution of Code Generators Sven Jörges, 2013-01-12 Automatic code generation is an essential cornerstone of model driven approaches to software development. Currently lots of techniques are available that support the specification and implementation of code generators such as engines based on templates or rule based transformations. All those techniques have in common that code generators are either directly programmed or described by means of textual specifications. This monograph presents Genesys a general approach which advocates the graphical development of code generators for arbitrary source and target languages on the basis of models and services. In particular it is designed to support incremental language development on arbitrary metalevels. The use of models allows building code generators in a truly platform independent and domain specific way. Furthermore models are amenable to formal verification methods such as model checking which increase the reliability and robustness of the code generators. Services enable the reuse and integration of existing code generation frameworks and tools regardless of their complexity and at the same time manifest as easy to use building blocks which facilitate agile development through quick interchangeability. Both models and services are reusable and thus form a growing repository for the fast creation and evolution of code generators. **Logic Programming**

John Lloyd, 1995 The International Logic Programming Symposium is one of two major international conferences sponsored by the Association of Logic Programming. Both conferences are held annually. The theme for the 1995 conference was Declarative Systems particularly the integration of the logic programming functional programming and object oriented programming paradigms. Instrumentation Papers, BCS-18A Command Decoder-selector Hans Laping, 1980 This report describes an 18 channel command decoder selector which operates in conjunction with an HF command receiver to allow secure and reliable radio control of high altitude balloon payloads. An Extensible Component & Connector Architecture Description Infrastructure for Multi-Platform Modeling Andreas Wortmann, 2016-11-08

Software engineering for complex systems requires abstraction, multi domain expertise, separation of concerns, and reuse. Domain experts rarely are software engineers and should formulate solutions using their domain's vocabulary instead of general purpose programming languages. GPLs. Successful integration of domain specific languages (DSLs) into a software system requires a separation of concerns between domain issues and integration issues while retaining a loose enough coupling to support DSL reuse in different contexts. Component based software engineering (CBSE) increases reuse and separation of concerns by encapsulating functionalities in components. Components are GPL artifacts which raises accidental complexities. Model driven engineering (MDE) abstracts from GPLs by lifting models to primary development artifacts. Models can be abstract and better comprehensible by using domain vocabulary instead of a GPL. They can be platform independent and translated into GPLs for different target platforms. Component connector C/C architecture description languages (ADLs) combine CBSE and MDE to compose architectures from component models. We present concepts for engineering software systems with exchangeable component behavior languages. The concepts are realized in a software architecture modeling infrastructure that comprises modeling languages to develop applications based on C/C software architectures with exchangeable component behavior DSLs. It supports transformations from platform independent to platform specific software architectures and compositional code generation. With this it enables domain experts to re-use the most appropriate component behavior DSL and facilitates composition of domain solutions through encapsulation in components.
