Smart Structures Tunnels:

Smart Structures Theory Inderjit Chopra, Jayant Sirohi, 2014 This book focuses on smart materials and structures which are also referred to as intelligent adaptive active sensory and metamorphic. The ultimate goal is to develop biologically inspired multifunctional materials with the capability to adapt their structural characteristics, monitor their health condition, perform self diagnosis and self repair, morph their shape and undergo significant controlled motion. *Smart Structures and Materials*, 2000

Structures Technology for Future Aerospace Systems Ahmed Khairy Noor, 2000 Wind Tunnels Satoru Okamoto, 2011-02-10 Although great advances in computational methods have been made in recent years, wind tunnel tests remain essential for obtaining the full range of data required to guide detailed design decisions for various practical engineering problems. This book collects original and innovative research studies on recent applications in wind tunnel tests, exhibiting various investigation directions and providing a bird's eye view on this broad subject area. It is composed of seven chapters that have been grouped in two major parts. The first part of the book, chapters 1-4, deals with wind tunnel technologies and devices. The second part, chapters 5-7, deals with the latest applications of wind tunnel testing. The text is addressed not only to researchers but also to professional engineers, engineering lecturers, and students seeking to gain better understanding of the current status of wind tunnels. Through its seven chapters, the reader will have access to a wide range of works related to wind tunnel testing.

Structural Health Monitoring 2013: A Roadmap to Intelligent Structures Fu-Kuo Chang, 2013-09-26 Original research on SHM: sensors, quantification, strategies, system integration, and control for a wide range of engineered materials. New applications in robotics, machinery, as well as military aircraft, railroads, highways, bridges, pipelines, stadiums, tunnels, space exploration, and energy production. Continuing a critical book series on structural health monitoring, SHM, this two-volume set with full-text searchable CD-ROM offers, as its subtitle implies, a guide to greater integration and control of SHM systems. Specifically, the volumes contain new research that will enable readers to more efficiently link sensor detection, diagnostics, quantification, overall system functionality, and automated e.g. robotic control, thus further closing the loop from inherent signal-based damage detection to responsive real-time maintenance and repair. SHM performance is demonstrated in monitoring the behavior of composites, metals, concrete, polymers, and selected nanomaterials in a wide array of surroundings, including harsh environments under extreme e.g. seismic loading and in space. New information on smart sensors and network optimization is enhanced by novel statistical and model-based methods for signal processing and data quantification. A special feature of the book is its explanation of emerging control technologies. Research in these volumes was initially presented in September 2013 at the 9th International Workshop on Structural Health Monitoring (IWSHM) held at Stanford University and sponsored by the Air Force Office of Scientific Research, the Army Research Laboratory, and the Office of Naval Research.
