Risk Analysis in Finance and Insurance Alexander Melnikov, 2004-06-02 Historically financial and insurance risks were separate subjects most often analyzed using qualitative methods The development of quantitative methods based on stochastic analysis is an important achievement of modern financial mathematics one that can naturally be extended and applied in actuarial mathematics Risk Analysis in Finance and Insurance offers the first comprehensive and accessible introduction to the ideas methods and probabilistic models that have transformed risk management into a quantitative science and led to unified methods for analyzing insurance and finance risks The author's approach is based on a methodology for estimating the present value of future payments given current financial insurance and other information which leads to proper practical definitions of the price of a financial contract the premium for an insurance policy and the reserve of an insurance company Self contained and full of exercises and worked examples Risk Analysis in Finance and Insurance serves equally well as a text for courses in financial and actuarial mathematics and as a valuable reference for financial analysts and actuaries Ancillary electronic materials will be available for download from the publisher's Web site

Semi-Markov Risk Models for Finance, Insurance and Reliability Jacques Janssen, Raimondo Manca, 2007-05-15 This book aims to give a complete and self contained presentation of semi Markov models with finitely many states in view of solving real life problems of risk management in three main fields Finance Insurance and Reliability providing a useful complement to our first book Janssen and Manca 2006 which gives a theoretical presentation of semi Markov theory However to help assure the book is self contained the first three chapters provide a summary of the basic tools on semi Markov theory that the reader will need to understand our presentation For more details we refer the reader to our first book Janssen and Manca 2006 whose notations definitions and results have been used in these four first chapters Nowadays the potential for theoretical models to be used on real life problems is severely limited if there are no good computer programs to process the relevant data We therefore systematically propose the basic algorithms so that effective numerical results can be obtained Another important feature of this book is its presentation of both homogeneous and non homogeneous models It is well known that the fundamental structure of many

real life problems is n homogeneous in time and the application of homogeneous models to such problems gives in the best case only approximated results or in the worst case nonsense results
