Ethylbenzene exposure in North America - an update Janet E. Kester, David A. Morgott, 2023-01-01 Chronic ethylbenzene exposures and attendant potential health risks for United States children and prospective parents were first evaluated under the United States Environmental Protection Agency's Voluntary Children's Chemical Evaluation Program Using updated data and methods a 2015 reevaluation observed declines in ethylbenzene releases and concentrations in ambient and indoor air Both assessments identified inhalation as the dominant exposure route and smoking as the greatest contributor with dietary intake much lower Children's exposure concentrations were similar to that of adults but their intakes were higher Neither breastfeeding nor toy mouthing was a significant source This report updates the previous assessments summarizing current ethylbenzene concentrations in air and foods exposures during the use of household and consumer products nationally representative biomonitoring data including expanded demographic groups and a new survey of worker exposures in styrene production facilities General population ethylbenzene exposures appear to have declined for all age groups The ethylbenzene styrene chain of commerce contributes an estimated 0.1% to total air emissions and 7% to 12% to dietary concentrations Total estimated ethylbenzene intakes are consistent with biomonitoring data Lactational transfer is not a significant exposure pathway for breastfed infants Production workers exposure is well below occupational guidelines Updated exposure estimates for each pathway suitable for potential health risk assessment are proposed
