Stochastic Modelling In Physical Oceanography:

Stochastic Modelling in Physical Oceanography Robert Adler, Peter Müller, B.L. Rozovskii, 2012-12-06 The study of the ocean is almost as old as the history of mankind itself When the first seafarers set out in their primitive ships they had to understand as best they could tides and currents eddies and vortices for lack of understanding often led to loss of life These primitive oceanographers were of course primarily statisticians They collected what empirical data they could and passed it down initially by word of mouth to their descendants Data collection continued throughout the millennia and although data bases became larger more reliable and better codified it was not really until surprisingly recently that mankind began to try to understand the physics behind these data and shortly afterwards to attempt to model it The basic modelling tool of physical oceanography is today the partial differential equation Somehow we all know that if only we could find the right set of equations with the right initial and boundary conditions then we could solve the mysteries of ocean dynamics once and for all

Transport and Mixing in Geophysical Flows Jeffrey B. Weiss, Antonello Provenzale, 2007-12-07 Transports in fluids can be approached from two complementary perspectives In the Eulerian view of mixing the focus is on the concentration field In the Lagrangian view fluid parcels are followed around as they move with the flow experiencing chaotic or stochastic motion This book examines both pictures presenting a number of theoretical and experimental lectures on various aspects of transport and mixing of active and passive particles in geophysical flows

Advection and Diffusion in Random Media Leonid Piterbarg, A. Ostrovskii, 2013-11-11 This book originated from our

interest in sea surface temperature variability Our initial though entirely pragmatic goal was to derive adequate mathematical tools for handling certain oceanographic problems Eventually however these considerations went far beyond oceanographic applications partly because one of the authors is a mathematician We found that many theoretical issues of turbulent transport problems had been repeatedly discussed in fields of hydrodynamics plasma and solid matter physics and mathematics itself There are few monographs concerned with turbulent diffusion in the ocean Csanady 1973 Okubo 1980 Monin and Ozmidov 1988 While selecting material for this book we focused first on theoretical issues that could be helpful for understanding mixture processes in the ocean and second on our own contribution to the problem Mathematically all of the issues addressed in this book are concentrated around a single linear equation the stochastic advection diffusion equation There is no attempt to derive universal statistics for turbulent flow Instead the focus is on a statistical description of a passive scalar tracer under given velocity statistics As for applications this book addresses only one phenomenon transport of sea surface temperature anomalies Hopefully however our two main approaches are applicable to other subjects

Recent Advances in Partial Differential Equations, Venice 1996 Peter D. Lax, L. Nirenberg, Renato Spigler, 1998 Lax and Nirenberg are two of the most distinguished mathematicians of our times Their work on partial differential equations PDEs over the last half century has dramatically advanced the subject and has profoundly influenced the course of mathematics A huge part of the development in PDEs during this period has either been through their work motivated by it or achieved by their postdocs and students A large number of mathematicians honored these two exceptional scientists in a week long conference in Venice June 1996 on the occasion of their 70th birthdays This volume contains the proceedings of the conference which focused on the modern theory of nonlinear PDEs and their applications Among the topics treated are turbulence kinetic models of a rarefied gas vortex filaments dispersive waves singular limits and blow up solutions conservation laws Hamiltonian systems and others The conference served as a forum for the dissemination of new scientific ideas and discoveries and enhanced scientific communication by bringing together such a large number of scientists working in related fields The event allowed the international mathematics community to honor two of its outstanding members

Preventive Methods for Coastal Protection Tarmo Soomere, Ewald Quak, 2013-06-28 The aim of the book is to present for non specialist researchers as well as for experts a comprehensive overview of the background key ideas basic methods implementation details and a selection of solutions offered by a novel technology for the optimisation of the location of dangerous offshore activities in terms of environmental criteria as developed in the course of the BalticWay project The book consists of two parts The first part introduces the basic principles of ocean modeling and depicts the long way from the generic principles to the practical modeling of oil spills and of the propagation of other adverse impacts The second part focuses on the techniques for solving the inverse problem of the quantification of offshore areas with respect to their potential to serve as a source of environmental danger to vulnerable regions such as spawning nursing or also tourist areas

The chapters are written in a tutorial style they are mostly self contained and understandable for non specialist researchers and students They are carefully peer reviewed by international experts The goal was to produce a book that highlights all key steps methods models and data sets it is necessary to combine in order to produce a practically usable technology and or decision support system for a particular sea region Thus the book is useful not only as a description and a manual of this particular technology but also as a roadmap highlighting the complicated technical issues of ocean modeling for practical purposes It describes the approaches taken by the authors in an understandable way and thus is useful for educational purposes such as a course in industrially and environmentally relevant applications of ocean modeling

Schrödinger Diffusion Processes Robert Aebi, 2012-12-06 In 1931 Erwin Schrödinger considered the following problem A huge cloud of independent and identical particles with known dynamics is supposed to be observed at finite initial and final times What is the most probable state of the cloud at intermediate times The present book provides a general yet comprehensive discourse on Schrödinger s question Key roles in this investigation are played by conditional diffusion processes pairs of non linear integral equations and interacting particles systems The introductory first chapter gives some historical background presents the main ideas in a rather simple discrete setting and reveals the meaning of intermediate prediction to quantum mechanics In order to answer Schrödinger s question the book takes three distinct approaches dealt with in separate chapters transformation by means of a multiplicative functional projection by means of relative entropy and variation of a functional associated to pairs of non linear integral equations The book presumes a graduate level of knowledge in mathematics or physics and represents a relevant and demanding application of today s advanced probability theory

Advances in Geophysics, 1999-06-18 Advances in Geophysics Vol 40 systematically compares many of the currently used statistical approaches to time series analysis and modeling to evaluate each method s robustness and application to geophysical datasets This volume tackles the age old problem of how to evaluate the relative roles of deterministic versus stochastic processes signal vs noise in their observations The book introduces the fundamentals in

sections titled 1 2 What is a Time Series and 1 3 How is a Time Series Quantified before diving into Spectral Analysis Semivariograms Rescaled Range Analysis and Wavelet Analysis The second half of the book applies their self affine analysis to a number of geophysical time series historical temperature records drought hazard assessment sedimentation in the context of hydrocarbon bearing strata variability of the Earth s magnetic field This volume explores in detail one of the main components of noise that of long range persistence or memory The first chapter is a broad summary of theory and techniques of long range persistence in time series the second chapter is the application of long range persistence to a variety of geophysical time series

Laws of Small Numbers: Extremes and Rare Events Michael Falk,Jürg Hüsler,Rolf-Dieter Reiss,2013-11-11 Since the publication of the first edition of this seminar book in 1994 the theory and applications of extremes and rare events have enjoyed an enormous and still increasing interest The intention of the book is to give a mathematically oriented development of the theory of rare events underlying various applications This characteristic of the book was strengthened in the second edition by incorporating various new results on about 130 additional pages Part II which has been added in the second edition discusses recent developments in multivariate extreme value theory Particularly notable is a new spectral decomposition of multivariate distributions in univariate ones which makes multivariate questions more accessible in theory and practice One of the most innovative and fruitful topics during the last decades was the introduction of generalized Pareto distributions in the univariate extreme value theory Such a statistical modelling of extremes is now systematically developed in the multivariate framework

Probabilistic Behavior of Harmonic Functions Rodrigo Banuelos,Charles N. Moore,1999-08 Harmonic analysis and probability have long enjoyed a mutually beneficial relationship that has been rich and fruitful This monograph aimed at researchers and students in these fields explores several aspects of this relationship The primary focus of the text is the nontangential maximal function and the area function of a harmonic function and their probabilistic analogues in martingale theory The text first gives the requisite background material from harmonic analysis and discusses known results concerning the nontangential maximal function and area function as well as the central and essential role these have played in the development of the field The book next discusses further refinements of traditional results among these are sharp good lambda inequalities and laws of the iterated logarithm involving nontangential maximal functions and area functions Many applications of these results are given Throughout the constant interplay between probability and harmonic analysis is emphasized and explained The text contains some new and many recent results combined in a coherent presentation

Particles in the Coastal Ocean Daniel R. Lynch,2015 This book summarizes the modeling of the transport evolution and fate of particles in the coastal ocean for advanced students and researchers

High Dimensional Probability II Evarist Giné,David M. Mason,Jon A. Wellner,2012-12-06 High dimensional probability in the sense that encompasses the topics represented in this volume began about thirty years ago with research in two related areas limit theorems for sums of independent Banach space valued

random vectors and general Gaussian processes An important feature in these past research studies has been the fact that they highlighted the essential probabilistic nature of the problems considered In part this was because by working on a general Banach space one had to discard the extra and often extraneous structure imposed by random variables taking values in a Euclidean space or by processes being indexed by sets in \mathbb{R} or \mathbb{R}^d Doing this led to striking advances particularly in Gaussian process theory It also led to the creation or introduction of powerful new tools such as randomization decoupling moment and exponential inequalities chaining isoperimetry and concentration of measure which apply to areas well beyond those for which they were created The general theory of empirical processes with its vast applications in statistics the study of local times of Markov processes certain problems in harmonic analysis and the general theory of stochastic processes are just several of the broad areas in which Gaussian process techniques and techniques from probability in Banach spaces have made a substantial impact Parallel to this work on probability in Banach spaces classical probability and empirical process theory were enriched by the development of powerful results in strong approximations

Ocean Resources D.A. Arduş, M.A. Champ, 2012-12-06 Today western nations consume annually only a small percentage of their resources from the sea despite the proclamation of Exclusive Economic Zones EEZ by many In contrast most Pacific Basin Countries obtain more than a quarter of their annual needs from the ocean Determination of greater rewards from the development of marine resources is markedly inhibited by the limited technical abilities available to locate and assess them Knowledge of Exclusive Economic Zone resources is schematic and generalised and a detailed understanding of the geology and processes relating to the economic use of the seafloor is both fragmentary and very basic Technology for mapping the mineral resources of continental shelves and ocean areas except in active offshore hydrocarbon provinces has been largely developed in pursuit of scientific objectives and competence to rapidly appraise economic potential is limited Similarly the capability to characterise and evaluate the other resources of the seas is rudimentary The development of ocean resources will become increasingly urgent as the growth of the world population and the depletion of land reserves combine to enhance demand Also increasing environmental constraints will limit the availability of traditional land based resources nevertheless new offshore development must proceed in a manner whereby the marine environment is not plundered but protected and conserved The challenge to develop ocean resources with responsible environmental stewardship will require greater leadership than the development of the technologies of exploitation
