A Comparison of Cockpit Warning Systems Almon J. Bate,Charles Bates (Jr.),1967 The experiment was designed to compare three types of aircraft cockpit warning systems 1 Visual malfunctions simultaneously activated a master warning light and a specific malfunction indicator light 2 Visual and tone malfunctions simultaneously activated an intermittent sweeping tone through earphones a master warning light and a specific malfunction indicator light 3 Visual and voice malfunctions simultaneously activated a master warning light a specific malfunction indicator light and a voice recording which informed the operator through his earphones of the specific malfunction needing attention Three groups of 11 university students served as subjects While responding to a visual visual tone or visual voice warning system each subject was also required to find and position under cross hairs a series of strategic targets on a strip of rear projected aerial photographic imagery No statistically significant differences among the three warning systems were found in the speed of reaction to the master warning light reaction to the specific indicator panel total reaction time or number of strategic targets found or missed The results of the study suggest that the addition of either a tone or a voice warning to a visual master plus specific malfunction warning system is of questionable value in a heads in cockpit situation where the visual system can be seen The data from the experiment do not suggest that a voice warning system has any advantage over a simple aural signal for augmenting a visual system Author *Report* United States.
