Nonlinear and Stochastic Dynamics of Compliant Offshore Structures Seon Mi Han, Haym Benaroya, 2002-04-30 The purpose of this monograph is to show how a compliant offshore structure in an ocean environment can be modeled in two and three dimensions The monograph is divided into five parts Chapter 1 provides the engineering motivation for this work that is offshore structures These are very complex structures used for a variety of applications It is possible to use beam models to initially study their dynamics Chapter 2 is a review of variational methods and thus includes the topics principle of virtual work D'Alembert's principle Lagrange's equation Hamilton's principle and the extended Hamilton's principle These methods are used to derive the equations of motion throughout this monograph Chapter 3 is a review of existing transverse beam models They are the Euler-Bernoulli Rayleigh shear and Timoshenko models The equations of motion are derived and solved analytically using the extended Hamilton's principle as outlined in Chapter 2 For engineering purposes the natural frequencies of the beam models are presented graphically as functions of normalized wave number and geometrical and physical parameters Beam models are useful as representations of complex structures In Chapter 4 a fluid force that is representative of those that act on offshore structures is formulated The environmental load due to ocean current and random waves is obtained using Morison's equation The random waves are formulated using the Pierson-Moskowitz spectrum with the Airy linear wave theory
