Dynamic Stabilisation of the Biped Lucy Powered by Actuators with Controllable Stiffness Bram Vanderborght, 2010-10-04 This book reports on the developments of the bipedal walking robot Lucy Special about it is that the biped is not actuated with the classical electrical drives but with pleated pneumatic artificial muscles In an antagonistic setup of such muscles both the torque and the compliance are controllable From human walking there is evidence that joint compliance plays an important role in energy efficient walking and running Moreover pneumatic artificial muscles have a high power to weight ratio and can be coupled directly without complex gearing mechanism which can be beneficial towards legged mechanisms Additionally they have the capability of absorbing impact shocks and store and release motion energy This book gives a complete description of Lucy the hardware the electronics and the software A hybrid simulation program combining the robot dynamics and muscle valve thermodynamics has been written to evaluate control strategies before implementing them in the real biped

Numerical Modelling in Robotics Edgar Alonso Martínez García, 2015-10-06 Modern robotic systems are tied to operate autonomously in real world environments performing a variety of complex tasks Autonomous robots must rely on fundamental capabilities such as locomotion trajectory tracking control multi sensor fusion task path planning navigation and real time perception Combining this knowledge is essential to design rolling walking aquatic and hovering robots that sense and self control This book contains a mathematical modelling framework to support the learning of modern robotics and mechatronics aimed at advanced undergraduates or first year PhD students as well as researchers and practitioners The volume exposes a solid understanding of mathematical methods as a common modelling framework to properly interpret advanced robotic systems Including numerical approximations solution of linear and non linear systems of equations curves fitting differentiation and integration of functions The book is suitable for courses on robotics mechatronics sensing models vehicles design and control modelling simulation and mechanisms analysis It is organised with 17 chapters divided in five parts that conceptualise classical mechanics to model a wide variety of applied robotics It comprehends a hover craft an amphibious hexapod self reconfiguration and under actuation of rolling and passive walking robots with Hoekens Klann and Jansen limbs for bipedal quadruped and octapod robots
