Landscape Evolution Jonathan D. Phillips, 2021-04-30 Landscape Evolution Landforms Ecosystems and Soils asks us to think holistically to look for the interactions between the Earth's component surface systems to consider how universal laws and historical and geographical contingency work together and to ponder the implications of nonlinear dynamics in landscapes ecosystems and soils Development evolution landforms topography soils ecosystems and hydrological systems are inextricably intertwined While empirical studies increasingly incorporate these interactions theories and conceptual frameworks addressing landforms soils and ecosystems are pursued largely independently This is partly due to different academic disciplines traditions and lexicons involved and partly due to the disparate time scales sometimes encountered Landscape Evolution explicitly synthesizes and integrates these theories and threads of inquiry arguing that all are guided by a general principle of efficiency selection A key theme is that evolutionary trends are probabilistic emergent outcomes of efficiency selection rather than purported goal functions This interdisciplinary reference will be useful for academic and research scientists across the Earth sciences Serves as a primary theoretical resource on landscape evolution Earth surface system development and environmental responses to climate and land use change Incorporates key ideas on geomorphic soil hydrologic and ecosystem evolution and responses in a single book Includes case studies to provide real world examples of evolving landscapes

Soil Geomorphology A.J. Gerrard, 1992-10-31 Soil geomorphology is the accurate assessment of the genetic relationship of soils and landforms which is possible only if their interdependence is recognized This book provides an integration of geomorphology and pedology Students and scientists in many disciplines should find this book highly relevant to their interests

Soils, Ecosystem Processes, and Agricultural Development Shinya Funakawa, 2017-05-16 The main objective of this book is to integrate environmental knowledge observed in local agriculture based on the understanding of soils science and ecology and to propose possible technical solutions and a more integrated approach to tropical agriculture The chapters describe and analyze the ecological and technical countermeasures available for mitigating environmental degradation due to the increasing agricultural activities by humans based on our scientific understanding of traditional agriculture in the tropics This is an effective approach as such ecological and technical tools previously involved in traditional activities are expected to be easily incorporated into present agricultural systems The book starts with a rather classical pedological issue and analyzed traditional agricultural practices with different resource management strategies in terms of their modification of natural biological processes It focuses on the present situation of tropical agriculture that is resource utilization in modern agriculture after application of technical innovation increased application of chemical fertilizers as well as agricultural chemicals Here possible technical approaches to resource management that reasonably support agricultural production whilst mitigating environmental degradation are discussed The

negative impacts of agricultural development on our environment are rapidly growing yet we are increasingly dependent on the agricultural sector for food and energy The situation is similar in the tropics where subsistence agriculture with low input management has long comprised most agricultural systems Comparison of ecological and or agronomical studies between different continents are still rare therefore this analysis may help clarify what is an essential problem when considering technical transportation beyond continents and or between temperate and tropical regions

Principles and Dynamics of the Critical Zone, 2015-06-18 Principles and Dynamics of the Critical Zone is an invaluable resource for undergraduate and graduate courses and an essential tool for researchers developing cutting edge proposals It provides a process based description of the Critical Zone a place that The National Research Council 2001 defines as the heterogeneous near surface environment in which complex interactions involving rock soil water air and living organisms regulate the natural habitat and determine the availability of life sustaining resources This text provides a summary of Critical Zone research and outcomes from the NSF funded Critical Zone Observatories providing a process based description of the Critical Zone in a wide range of environments with a specific focus on the important linkages that exist amongst the processes in each zone This book will be useful to all scientists and students conducting research on the Critical Zone within and outside the Critical Zone Observatory Network as well as scientists and students in the geosciences atmosphere geomorphology geology and pedology The first text to address the principles and concepts of the Critical Zone A comprehensive approach to the processes responsible for the development and structure of the Critical Zone in a number of environments An essential tool for undergraduate and graduate students and researchers developing cutting edge proposals

Principles of Soilscape and Landscape Evolution Garry Willgoose, 2018-03-01 Computational models are invaluable in understanding the complex effects of physical processes and environmental factors which interact to influence landform evolution of geologic time scales This book provides a holistic guide to the construction of numerical models to explain the co evolution of landforms soil vegetation and tectonics and describes how the geomorphology observable today has been formed It explains the science of the physical processes and the mechanics of how to solve them providing a useful resource for graduates studying geomorphology and sedimentary and erosion processes It also emphasises the methods for assessing the relative importance of different factors at field sites enabling researchers to select the appropriate processes to model Integrating a discussion of the fundamental processes with mathematical formulations it guides the reader in understanding which processes are important and why and creates a framework through which to study the interaction of soils vegetation and landforms over time
