Methodology for the Digital Calibration of Analog Circuits and Systems Marc Pastre, Maher Kayal, 2006-01-17 Methodology for the Digital Calibration of Analog Circuits and Systems shows how to relax the extreme design constraints in analog circuits allowing the realization of high precision systems even with low performance components A complete methodology is proposed and three applications are detailed To start with an in depth analysis of existing compensation techniques for analog circuit imperfections is carried out The M 2 M sub binary digital to analog converter is thoroughly studied and the use of this very low area circuit in conjunction with a successive approximations algorithm for digital compensation is described A complete methodology based on this compensation circuit and algorithm is then proposed The detection and correction of analog circuit imperfections is studied and a simulation tool allowing the transparent simulation of analog circuits with automatic compensation blocks is introduced The first application shows how the sub binary M 2 M structure can be employed as a conventional digital to analog converter if two calibration and radix conversion algorithms are implemented The second application a SOI 1T DRAM is then presented A digital algorithm chooses a suitable reference value that compensates several circuit imperfections together from the sense amplifier offset to the dispersion of the memory read currents The third application is the calibration of the sensitivity of a current measurement microsystem based on a Hall magnetic field sensor Using a variant of the chopper modulation the spinning current technique combined with a second modulation of a reference signal the sensitivity of the complete system is continuously measured without interrupting normal operation A thermal drift lower than 50 ppm C is achieved which is 6 to 10 times less than in state of the art implementations Furthermore the calibration technique also compensates drifts due to mechanical stresses and ageing

CMOS Processors and Memories Krzysztof Iniewski, 2010-08-09 CMOS Processors and Memories addresses the state of the art in integrated circuit design in the context of emerging computing systems. New design opportunities in memories and processor are discussed. Emerging materials that can take system performance beyond standard CMOS like carbon nanotubes, graphene, ferroelectrics, and tunnel junctions are explored. CMOS Processors and Memories is divided into two parts: processors and memories. In the first part, we start with high performance, low power processor design, followed by a chapter on multi core processing. They both represent state of the art concepts in current computing industry. The third chapter deals with asynchronous design that still carries lots of promise for future computing needs. At the end, we present a hardware design space exploration methodology for implementing and analyzing the hardware for the Bayesian inference framework. This particular methodology involves analyzing the computational cost and exploring candidate hardware components, proposing various custom architectures using both traditional CMOS and hybrid nanotechnology CMOL. The first part concludes with hybrid CMOS Nano architectures. The second memory part covers state of the art SRAM, DRAM, and flash memories, as well as emerging device concepts. Semiconductor memory is a good example of the full custom design that applies various analog and logic circuits to utilize the memory cell's device physics. Critical physical effects that include tunneling, hot electron injection, charge trapping, Flash memory are discussed in detail. Emerging memories like FRAM, PRAM, and ReRAM that depend on magnetization, electron spin alignment, ferroelectric effect, built-in potential well, quantum effects, and thermal melting are also described. CMOS Processors and Memories is a must for anyone serious about circuit design for future computing technologies. The book is written by top notch international experts in industry and academia. It can be used in graduate course curriculum.
