Earl, John McDermid, 1992 **User-centred Requirements for Software Engineering Environments** David J. Gilmore, Russel Winder, Françoise Détienne, 1994 The idea for this workshop originated when I came across and read Martin Zelkowitz's book on Requirements for Software Engineering Environments the proceedings of a small workshop held at the University of Maryland in 1986 Although stimulated by the book I was also disappointed in that it didn't adequately address two important questions Whose requirements are these and Will the environment which meets all these requirements be usable by software engineers And thus was the decision made to organise this workshop which would explicitly address these two questions As time went by setting things up it became clear that our workshop would happen more than five years after the Maryland workshop and thus at the same time as addressing the two questions above this workshop would attempt to update the Zelkowitz approach Hence the workshop acquired two halves one dominated by discussion of what we already know about usability problems in software engineering and the other by discussion of existing solutions technical and otherwise to these problems This scheme also provided a good format for bringing together those in the HCI community concerned with the human factors of software engineering and those building tools to solve acknowledged but rarely understood problems

**Process-centered Software Engineering Environments** Pankaj K. Garg, Mehdi Jazayeri, 1996 Process Centered Software Engineering Environments PSEEs represent a new generation of software engineering environments in which the processes used to produce and maintain software products are

explicitly modeled in the environment PSEEs hold the exciting promise of enabling a significant increase in both software productivity and quality The book presents a comprehensive picture of this emerging technology while highlighting the key concepts and issues The first chapter introduces some of the basic concepts and developments behind PSEEs and discusses the unifying role it plays in combining project management software engineering and process engineering The second chapter reviews related process modeling and representation concepts terminology and issues Chapter 3 analyzes the features of some example PSEEs and Chapter 4 takes an inside look at the implementation of these features by describing specific design choices made by researchers The last chapter discusses the evolution of PSEEs to accommodate practical issues in actual work settings and to play a more significant role in the software life cycle The text is a collection of influential papers that will bring the newcomer quickly up to speed on this fast moving field For the researcher the issues described in the text present a challenge to be conquered and directions to pursue For the practitioner they represent benefits that may be gained in the application of PSEEs in the work environment

Software Development Environments and Case Technology Albert Endres, Herbert Weber, 1991-06-10

Software development environments are integrated sets of tools techniques and processes that assist in the systematic development of software products They are intended to support all phases of the software development cycle requirements definition design implementation test and maintenance These Computer Aided Software Engineering CASE tools typically make use of graphic manipulation facilities and rely on some form of development database to exchange various types of design objects between tools Facilitated by the availability of powerful workstations implementations of these technologies are now within reach of every software developer This volume presents the proceedings of a symposium organized by the GI Gesellschaft f r Informatik the GMD Gesellschaft f r Mathematik und Datenverarbeitung and ESEC European Software Engineering Conferences The symposium brought together application development managers and top specialists involved in the selection and introduction of software development tools leading developers of such tools and well known authorities from the research community The proceedings contain first hand information on practical experiences and requirements development directions and strategies and key research issues and results

Requirements for a Software Engineering Environment Marvin V. Zelkowitz, 1989 This is a compilation of papers submitted by participants of a workshop organized to consider the requirments for a software engineering environment a programming environment that aids the professional programmer in completion of the tasks necessary to build and maintain large complex software systems The goal of the

workshop was to consider the requirement for such an environment by examining the contributions that could be made by recent advances in technology in a variety of computer science areas including methodology system architecture measurement and evaluation artificial intelligence verification databases human interfaces and programming languages

*Engineering Environment-Mediated Multi-Agent Systems* Danny Weyns, Sven A. Brueckner, Yves Demazeau, 2008-07-16  
Software intensive systems are increasingly expected to deal with changing user needs and dynamic operating conditions at run time Examples are the need for life recon gurations management of resource variability and dealing with p ticular failure modes Endowing systems with these kinds of capabilities poses severe challenges to software engineers and necessitates the development of new techniques practices and tools that build upon sound engineering principles The eld of multi agent systems focuses on the foundations and engineering of systems that consists of a network of autonomous entities agents that int act to achieve the system goals One line of research in multi agent systems inspired by biological physical and other naturally occurring systems concerns multi agent systems in which agents share information and coordinate their havior through a shared medium called an agent environment Typical examples are gradient elds and digital pheromones that guide agents in their local c text and as such facilitate the coordination of a community of agents Since environment mediation in multi agent systems has shown to result in mana ble solutions with very adaptable qualities it is a promising paradigm to deal with the increasing complexity and dynamism of distributed applications Control in environment mediated multi agent systems is decentralized i e none of the components has full access or control over the system Self organization is an approach to engineer decentralized distributed and resource limited systems that are capable of dynamically adapting to changing conditions and requirements without external intervention This useful system property is often re ected in functions such as self con guration self optimization and self healing Engine ing approaches to self organizing systems often rely on global functionality to emerge from local and autonomous decisions of individual agents that commu cate through a shared agent environment

emphasizing users conceptual understanding of information on a domain level on an algorithmic level or on representation levels On each level the objects and structures used on them are different and different rules govern the behavior on them Therefore the notions rules theories languages and methods for modelling on different levels are also different It will be useful if we can develop theories and methodologies for modelling to be used in different situations because databases knowledge bases and repositories in knowledge management systems developed on the basis of models and used to technically store information are growing day by day In this publication the interest is focused on modelling of information and one of the central topics is modelling of time Scientific and technical papers of high quality are brought together in this book
