Interstellar Medium Rudolf von Steiger,R. Lallement,M.A. Lee,2012-12-06 In summary we can conclude that the contributions of the different ionization processes to the total ionization rate for the most abundant interstellar species are basically known The ionization of the noble gases He and Ne is almost completely dominated by photoionization whereas for H charge exchange with the solar wind is most important For other species such as O and Ar both processes contribute significantly Electron impact ionization can typically contribute by 10% to the total rate in the inner Solar System Because direct measurements of the solar EUV flux are not yet continuously available the variation of the ionization rate over the solar cycle still contains a relatively large uncertainty The recent measurements of pickup ion distributions and of the neutral helium gas provide an independent tool to determine the total ionization rate that can be used to cross calibrate with the results obtained for the individual ionization processes Acknowledgements The authors are grateful to M Allen for supplying us with new data on photoionization cross sections compiled by him We thank also M Gruntman for drawing our attention to and support in collecting the most recent data on charge exchange cross sections D R was supported by grant No 2 P03C 004 09 from the Committee for Scientific Research Poland This work was also supported in part through NASA contract NAS7 918 NSF Grant INT 911637 NASA Grant NAGW 2579      *Energy and Water Development Appropriations for 2008* United
