Fundamentals of Shock Wave Propagation in Solids Lee Davison, 2008-05-07 My intent in writing this book is to present an introduction to the thermo mechanical theory required to conduct research and pursue applications of shock physics in solid materials Emphasis is on the range of moderate compression that can be produced by high velocity impact or detonation of chemical explosives and in which elastoplastic responses are observed and simple equations of state are applicable In the interest of simplicity the presentation is restricted to plane waves producing uniaxial deformation Although applications often involve complex multidimensional deformation fields it is necessary to begin with the simpler case This is also the most important case because it is the usual setting of experimental research The presentation is also restricted to theories of material response that are simple enough to permit illustrative problems to be solved with minimal recourse to numerical analysis The discussions are set in the context of established continuum mechanical principles I have endeavored to define the quantities encountered with some care and to provide equations in several convenient forms and in a way that lends itself to easy reference Thermodynamic analysis plays an important role in continuum mechanics and I have included a presentation of aspects of this subject that are particularly relevant to shock physics The notation adopted is that conventional in expositions of modern continuum mechanics insofar as possible and variables are explained as they are encountered Those experienced in shock physics may find some of the notation unconventional

Proceedings of the Army Symposium on Solid Mechanics, 1972, 1973

Constitutive Relation in High/Very High Strain Rates Kozo Kawata, Jumpei Shioiri, 2013-11-11 The IUTAM Symposium on Constitutive Relation in High Very High Strain Rates CRHVHSR was held October 16 19 1995 at Seminar House Science University of Tokyo under the sponsorship of IUTAM

Japan Society for the Promotion of Science The Commemorative Association for the Japan World Exposition 1970 Inoue Foundation for Science The Japan Society for Aeronautical and Space Sciences and Science University of Tokyo The proposal to hold the symposium was accepted by the General Assembly of IUTAM held in Haifa Israel in August 1992 and the scientists mentioned below were appointed by the Bureau of IUTAM to serve as members of the Scientific Committee The main object of the symposium was to make a general survey of recent developments in the research of constitutive relations in high and very high strain rates and related problems in high velocity solid mechanics and to explore further new ideas for dealing with unresolved problems of a fundamental nature as well as of practical importance The subjects covered theoretical experimental and numerical fields in the above mentioned problems in solids covering metals polymers ceramics and composites Emphasis was given to the following fields 1 Material characterization of solids in high velocity deformation experimental techniques typical data obtained by these techniques modeling and constitutive relations 2 Strain rate dependent elasto visco plastic stress waves 3 Crack initiation propagation and dynamic fracture toughness 4 Dynamic stress concentration 5 Structural dynamics in impact and constitutive relations of solids 6 **Material Properties under Intensive Dynamic Loading** Mikhail V. Zhernokletov, B. L. Glushak, 2007-07-16 Understanding the physical and thermomechanical response of materials subjected to intensive dynamic loading is a challenge of great significance in engineering today This volume assumes the task of gathering both experimental and diagnostic methods in one place since not much information has been previously disseminated in the scientific literature SPALL FRACTURE AND DYNAMIC RESPONSE OF MATERIALS, 1968 The report describes the time dependent fracture or spalling of materials as a result of dynamic response to shock wave or impulse loading From stress wave and fracture mechanics theory and assuming knowledge of the dynamic properties of the material theories are developed to predict the stress at the spall plane The cumulative energy stress rate and bond breaking models for the prediction of spall fracture are described along with the basic criteria of each model **High-Pressure Shock Compression of Solids** J.R. Asay, M. Shahinpoor, 2012-12-06 This book presents a set of basic understandings of the behavior and response of solids to propagating shock waves The propagation of shock waves in a solid body is accompanied by large compressions decompression and shear Thus the shear strength of solids and any inelastic response due to shock wave propagation is of the utmost importance Furthermore shock compression of solids is always accompanied by heating and the rise of local temperature which may be due to both compression and dissipation For many solids under a certain range of impact pressures a two wave structure arises such that the first wave called the elastic precursor travels with the speed of sound and the second wave called a plastic shock wave travels at a slower speed Shock wave loading of solids is normally accomplished by either projectile impact such as produced by guns or by explosives The shock heating and compression of solids covers a wide range of temperatures and densities For example the temperature may be as high as a few electron volts 1 eV 1.1×10^5 K for very strong shocks and the densification

may be as high as four times the normal density **Shock Waves** W. M. Isbell, 2005 This book presents in a concise and comprehensive manner the essential techniques by which shock wave physicists probe the boundaries of material response to impulsive loads The author is a well known figure in shock wave physics having worked for over forty years with many of the outstanding researchers in the field The book acquaints readers both with modern instrumentation techniques including interferometers such as the DISAR and the VISAR and with methods that have been established by previous generations of experimentalists including acoustic measurement techniques and low to moderate strain rate machines Besides an exposition of the theoretical aspects of shock wave phenomena it contains large amounts of data on equations of state spallation thresholds shock wave attenuation from very high pressures and elastic constants Much of this information has been previously unavailable in open publications The text documents the transition from testing performed with explosives to the use of modern compressed gas guns which permit much more detailed diagnostics and controlled conditions In particular the author pioneered the use of two stage light gas guns which launch high density plates against specimens located at the muzzle The high launch velocity of these guns produced data that represents the highest pressures obtained in the free world at that time
