The laws of the web: Patterns in the ecology of information by Bernardo A Huberman. The MIT Press, 5, Cambridge Center, Cambridge, MA 02142, USA, 2001, pp.105, \$ 24.95.

In this slim volume of less than 100 pages, the author discusses some interesting phenomenological observations on the web and how they can be used in better designs, for example, search engines. The book is aimed at the 'layman' though many of the intuitions discussed in the book have been inspired by models in physics (statistical mechanics, etc.) and many active workers in this field are also physicists.

The first empirical observation, after large statistical studies on the web, is that of the power law governing many relations such as the number of pages per site and the number of outgoing or incoming links to a page. This property is often termed as the self-similarity, i.e. the existence of the same distribution at all length scales. Because of this law, the average behaviour of the system is not that of the mode. A lognormal distribution results if we assume that changes in the sizes of sites over time are proportional to their sizes with random multiplicative factors. For power law (instead of the lognormal), two more factors are needed: sites appear at different times and that sites grow at different rates. The power law is similar to Zipf's law in linguistics where the frequency of the k th most occurring word in a language is inversely proportional to k .

Another interesting phenomenon is that of the 'small worlds': the existence of a chain of about 6–7 acquaintances before closure. On the web, it has been shown that four clicks are enough to navigate from a given random web site to another. This can be used to design better search engines: for any search, one can get the page rank (the frequency with which a page is referred to) and the closeness of the match for all the candidate pages.

Some editing errors: it would have been better to illustrate the lognormal distr with a figure when it is discussed in p. 28 than later in Ch. 7 (Fig. 7.1). The third sentence of the last para on p. 63 has some words missing. The word page rank is used without explanation in p. 38: it is unlikely to be known to a layman. In Table 8.1, the captions "% sites" and "%volume by user" need to be interchanged to be consistent with the text.

Overall, the book gives an useful insight into the dynamics of the web.

Applied computational economics and finance by M. J. Miranda and P. L. Fackler. The MIT Press, Cambridge, MA 02142, USA, 2002, pp. 510, \$70.

Many interesting economic and finance models cannot be solved analytically using mathematical techniques of algebra and calculus. This is often true of applied economic models that attempt to capture the complexities inherent in real-world economic behavior. For example, every day the financial markets bravely price trillions of dollars in such risky securities as stocks, bonds, options,

From System Complexity to Emergent Properties Moulay Aziz-Alaoui, Cyrille Bertelle, 2009-08-07 Emergence and complexity refer to the appearance of higher level properties and behaviours of a system that obviously comes from the collective dynamics of that system's components These properties are not directly deducible from the lower level motion of that system Emergent properties are properties of the whole that are not possessed by any of the individual parts making up that whole Such phenomena exist in various domains and can be described using complexity concepts and thematic knowledges This book highlights complexity modelling through dynamical or behavioral systems The pluridisciplinary purposes developed along the chapters are able to design links between a wide range of fundamental and applicative Sciences Developing such links instead of focusing on specific and narrow researches is characteristic of the Science of Complexity that we try to promote by this contribution

Network Science National Research Council, Division on Engineering and Physical Sciences, Board on Army Science and Technology, Committee on Network Science for Future Army Applications, 2006-01-15 The military is currently attempting to develop itself into a force capable of networkcentric operations While this effort has highlighted the military's dependence on interacting networks it has also shown that there is a huge gap between what we need to know about networks and our fundamental knowledge about network behavior This gap makes the military vision of NCO problematic To help address this problem the Army asked the NRC to find out whether identifying and funding a new field of network science could help close this gap This report presents an examination of networks and the military an analysis of the promise content and challenges of network science and an assessment of approaches to creating value from network science

Me++ William J. Mitchell, 2004-09-17 How the transformation of wireless technology and the creation of an interconnected world are changing our environment and our lives With *Me* the author of *City of Bits* and *e topia* completes an informal trilogy examining the ramifications of information technology in everyday life William Mitchell describes the transformation of wireless technology in the hundred years since Marconi the scaling up of networks and the scaling down of the apparatus for transmission and reception It is he says as if Brobdingnag had been rebooted as Lilliput Marconi's massive mechanism of tower and kerosene engine has been replaced by a palm size cellphone If the operators of Marconi's invention can be seen as human appendages to an immobile machine today's hand held devices can be seen as extensions of the human body This transformation has in turn changed our relationship with our surroundings and with each other The cellphone calls from the collapsing World Trade Center towers and the hijacked jets on September 11 were testimony to the intensity of this

new state of continuous electronic engagement Thus Mitchell proposes the trial separation of bits the elementary unit of information and atoms the elementary unit of matter is over With increasing frequency events in physical space reflect events in cyberspace and vice versa digital information can for example direct the movement of an aircraft or a robot arm In Me Mitchell examines the effects of wireless linkage global interconnection miniaturization and portability on our bodies our clothing our architecture our cities and our uses of space and time Computer viruses cascading power outages terrorist infiltration of transportation networks and cellphone conversations in the streets are symptoms of a dramatic new urban condition that of ubiquitous inescapable network interconnectivity He argues that a world governed less and less by boundaries and more and more by connections requires us to reimagine and reconstruct our environment and to reconsider the ethical foundations of design engineering and planning practice *Minnesota Law Review* ,2005 Bulletin of the American Society for Information Science and Technology ,2002 **Current Publications in Legal and Related Fields** ,2003 The British National Bibliography Arthur James Wells,2002 Books in Print Supplement ,2002 **Computational Linguistics** ,2002 **The Standard Periodical Directory** ,2003 **Subject Guide to Books in Print** ,1996 **El-Hi Textbooks in Print** ,1980 Books Out-of-print ,1986 Ulrich's Periodicals Directory 2005 R.
