

The Biology of Dreaming

- Crick and Mitchison (1983) believe that the brain's neural memory systems are easily overloaded and that REM eliminates cognitive debris. Dreams are a mechanism for the nervous system to clear the brain of unnecessary, even harmful memories. Remembered dreams are nothing more than an accidental by-product of this REM function.

lead to innovations in the medical social technical and biotech fields PUBLISHER S WEBSITE [Dreams 1900-2000](#) Lynn Gamwell, Equitable Gallery, 2000 Written to commemorate the centenary of Freud s classic work this illustrated book examines the shifting roles that dreams have played in twentieth century art and science BOOK JACKET **The Nature and Functions of Dreaming** Ernest Hartmann, 2011 The Nature and Function of Dreaming presents a comprehensive theory of dreaming based on many years of psychological and biological research by Ernest Hartmann and others Critical to this theory is the concept of a Central Image in this volume Hartmann describes his repeated finding that dreams of being swept away by a tidal wave are common among people who have recently experienced a trauma of some kind a fire an attack or a rape Dreams with these Central Images are not dreams of the traumatic experience itself but rather the Central Image reveals the emotional response to the experience Dreams with a potent Central Image like the tidal wave vary in intensity along with the severity of the trauma this pattern was shown quite powerfully in a systematic study of dreams occurring before and after the September 11 attacks in New York Hartmann s theory comprises three fundamental elements dreaming is simply one form of mental functioning occurring along a continuum from focused waking thought to reverie daydreaming and fantasy Second dreaming is hyperconnective linking material more fluidly and making connections that aren t made as readily in waking thought Finally the connections that are made are not random but rather are guided by the dreamer s emotions or emotional concerns and the more powerful the emotion the more intense the Central Image **Dreaming J.** Allan Hobson, 2002 What is dreaming Why are dreams so strange and why are they so hard to remember In this fascinating book Harvard researcher Allan Hobson offers an intriguing look at our nightly odyssey through the illusory world of dreams Hobson describes how the theory of dreaming has advanced dramatically over the past fifty years sparked by the use of EEGs in the 1950s and by recent innovations in brain imaging We have learned for instance that in dreaming some areas of the brain are very active the visual and auditory centers for instance while others are completely shut down including the centers for self awareness logic and memory Thus we can have visually vivid dreams but be utterly unaware that the sequence of events or locales may be bizarre and quite often impossible And because the memory center is inactive we don t remember the dream at all unless we wake up while it is in progress Hobson also shows that modern research has disproved most of Freud s The Interpretation of Dreams as one scientist put it Freud was 50% right and 100% wrong but we have gained new insight into the nature of mental illness The book also discusses dream disorders nightmares night terrors sleep walking the possible link between dreaming and the regulation of body temperature the effects of sleep deprivation and much more With special boxed features that highlight intriguing questions Do we dream in color yes Do animals dream probably Do men and women dream differently no Dreaming offers a cutting edge account of the most mysterious area of our mental life
