The Biology Of Normal Human Growth:

The Biology of Normal Human Growth Karolinska institutet,1981 *The Physiology of Human Growth* James Mourilyan Tanner,Michael A. Preece,1989-06-29 Covers a wide spectrum of growth physiology and presents a state of the art review of human auxology **Human Growth and Development** Noel Cameron, Lawrence Schell,2012-09-01 Offering a study of biological biomedical and biocultural approaches the second edition of Human Growth and Development is a valued resource for researchers professors and graduate students across the interdisciplinary area of human development With timely chapters on obesity diet lifestyle and genetics this edition is the only publication offering a biological biomedical and biocultural approach The second edition of Human Growth and Development includes contributions from the well known experts in the field and is the most reputable comprehensive resource available New chapters discussing genomics and epigenetics developmental origins body proportions and health and the brain and neurological development Presented in the form of lectures to facilitate student programming Updated content highlighting the latest research on the relationship between early growth and later adult outcomes the developmental origins of health and disease *The Biology of the First 1,000 Days* Crystal D Karakochuk,Kyly C. Whitfield,Tim J Green,Klaus Kraemer,2017-09-22 The first 1 000 days from conception to two years of age is a critical period of growth and development Exposures to dietary environmental hormonal and other stressors during this window have been associated with an increased risk of poor health outcomes some of which are irreversible The book addresses this crucial interval of early life across biological disciplines linking concepts related to all biological fields to outcomes during the first 1 000 days e g fetal growth and pregnancy outcomes and beyond e g gut microbiome and cardiovascular disease later in life The strength of this book lies in its cross disciplinary nature **Control of Animal Cell Proliferation** Alton L. Boynton,Hyam L. Leffert,2013-09-24 Control of Animal Cell Proliferation Volume I presents how animals regulate their proliferation activity and how cells become proliferatively autonomous resulting in malignant behavior This book provides an understanding of mechanisms that control animal cell proliferation Organized into five parts encompassing 17 chapters this volume begins with an overview of the efforts to elucidate the genetic alterations that lead normal cells to become cancer cells which have been aided considerably by the investigation of acute retroviruses This text then examines the factors involved in growth control Other chapters describe in detail the biology and biochemistry of epidermal growth factor EGF which have been elucidated through the study of cultured human fibroblasts This book discusses as well the protein kinases with specificity for tyrosine The final chapter deals with regulation of initiation of eukaryotic protein synthesis by phosphorylation This book is a valuable resource for scientists as well as cellular and molecular biologists Cell Culture in the Neurosciences Jane Bottenstein,2012-12-06 A fundamental problem in neuroscience is the elucidation of the cellular and molecular mechanisms underlying the development and function of the nervous system The complexity of organization the heterogeneity of cell types and their interactions and the difficulty of

controlling experimental variables in intact organisms make this a formidable task. Because of the ability that it affords to analyze smaller components of the nervous system even single cells in some cases and to better control experimental variables cell culture has become an increasingly valuable tool for neuroscientists. Many aspects of neural development such as proliferation, differentiation, synaptogenesis and myelination occur in culture with time courses remarkably similar to those in vivo. Thus in vitro methods often provide excellent model systems for investigating neurobiological questions. Ross Harrison described the first culture of neural tissue in 1907 and used morphological methods to analyze the cultures. Since that time the technique has been progressively modified and used to address an ever widening range of developmental questions. In recent years a convergence of new or improved cell culture, biochemical, electrophysiological and immunological methods has occurred and been brought to bear on neurobiological questions. This volume is intended not to be comprehensive but rather to highlight some of the latest findings with a review of previous important work as well in which combinations of these methods are used. Mesenchymal-Epithelial Interactions in Neural Development Joachim R. Wolff, Jobst Sievers, Martin Berry, 2013-06-29 This book is based on the NATO Advanced Research Workshop on Mesenchymal Epithelial Interactions in Neural Development which was held in Berlin during March 1986. The idea that it may be the time for this workshop arose from a discussion among the organizers who met at a conference in Innsbruck. During the twenties Spemann demonstrated that in vertebrates the formation of neuroepithelium depends on the induction by specific mesodermal derivatives. This was about the first time that mesenchymal epithelial interactions had been recognized as an important mechanism in the development of an epithelial organ. Since then two things had become clear: 1. The identity and role of molecules elaborated at mesenchymal neuroepithelial interfaces had been partially elucidated in spinal cord and peripheral nerve ontogeny but until recently had been ignored in studies on the development of the brain. 2. In many non neural epithelia the surrounding mesenchyme regulates such fundamental developmental steps as for example cell proliferation, morphogenesis and cell differentiation and there is no reason to exclude similar influences and interactions from brain development. It seemed to us that the importance and implications of many of these findings had not been appreciated by many developmental neurobiologists and that an attempt should be made to initiate discussions and exchange of ideas among different groups of scientists involved in extracellular matrix (ECM) research. This turned out to be a formidable task because of the great diversity of disciplines contributing findings to this active field. Neurotrophic Factors Sandra E. Loughlin, James H. Fallon, 2012-12-02 This volume clearly synthesizes current information on defined neurotrophic factors emphasizing their localization and molecular cellular function in the central nervous system. Brain development and aging, neurodegenerative disorders, plasticity and memory all are closely examined within the context of this rapidly expanding field. Researchers in neurobiology, cell biology and molecular biology will find Neurotrophic Factors an invaluable reference for their research libraries. Offers the most up

do date synthesis of concepts on neurotrophic factors in the nervous system Integrates molecular cellular and neuroanatomical concepts of neurotrophic factor function Includes special chapters on primary secondary and tertiary messenger systems Examines brain development differentiation neurodegenerative disorders and adult plasticity

Hormones and Lung Maturation Philip L. Ballard, 2012-12-06 As I reflect on the evolution of this book I am struck by the differences between my early conceptions and the final product When I was first approached by Springer Verlag regarding a monograph on my interests in the area of fetal lung development I imagined that it would be relatively easy to summarize my contributions plus the work of other investigators as needed for proper perspective This rather naive idea was abandoned as I prepared my initial outlines for the monograph I quickly realized that contributions from my laboratory are not sufficient for telling the story of hormones and lung maturation The result of this decision is a longer and more heavily referenced book than I originally envisioned Although I have attempted to discuss in considerable detail most aspects of hormones and the fetal lung I know with certainty that I have not included all relevant references in each area In most of these instances this reflects my impatience or lack of diligence and I offer my apologies to those investigators whose work has been so omitted In some situations published work has not been cited in a deliberate decision to limit the breadth of discussion or rarely due to my judgment of major shortcomings in experimental design or execution

Canine and Feline Endocrinology and Reproduction Edward C. Feldman, Richard William Nelson, 2004-01-01 This book provides complete current information on pathophysiology diagnosis and treatment of endocrine metabolic and reproductive diseases in dogs and cats It also discusses the importance of testing procedures in endocrine and reproductive diseases as well as cost effective and expedient diagnostic protocols A complete review of reproduction is presented with the endocrine material making this text the most inclusive resource overall on the topic Expansive sections on Canine Male and Female Reproduction The book is divided into nine sections for an organized and accessible approach to information Discussions of testing procedures in endocrine and reproductive diseases Explains cost effective and expedient diagnostic protocols Logical step by step guidelines aid in accurate decision making and diagnosis A new chapter in the Adrenal Gland section Section 3 addresses feline hyperadrenocorticism The chapter on diabetes mellitus in the canine and feline has been divided into two chapters in order to explore the specific aspects of the disease in each species All material has been extensively revised and brought up to date for this edition Additional tables and algorithms throughout the book summarize and clarify information
