The Blood-Brain Barrier in Health and Disease, Volume One Katerina Dorovini-Zis,2015-06-23 Located at the interface between blood and the brain the blood brain barrier is a dynamic permeability barrier formed by a continuous layer of specialized endothelial cells endowed with important permeability transport and regulatory functions that both protect the internal milieu of the brain and allow essential nutrients to be transported into

The Blood-Brain Barrier in Health and Disease William G. Mayhan,Denise M. Arrick,2016-12-15 The blood brain barrier BBB is a complex and dynamic structure that protects the brain from cells within the vasculature from the immune system and from pathogens This barrier is present in arterioles capillaries and venules and is formed at the level of adjacent endothelial cells which are coupled to astrocytes microglia neurons and pericytes The structure of this endothelial barrier is unique among endothelia of other organ systems and is composed of complexes made up of tight gap and adherens junctions In addition it is the responsibility of the surrounding cellular elements to maintain the integrity of the junctional complexes and restrict the entry of substances from the blood into the brain Changes in permeability of the BBB during physiologic and pathophysiologic conditions involve alterations in specific transporters at the level of the endothelium activation of specific cellular second messenger pathways and or the dissolution of the junctional complexes composing the BBB This book focuses on various aspects that account for the formation and maintenance of the BBB and on disease states that compromise this barrier

The Blood-Brain Barrier in Health and Disease Kason Benson,2023-09-26 The blood brain barrier BBB is responsible for the movement of ions molecules and cells between the blood and the CNS This barrier is essential for providing the right environment for healthy neuronal function and also for protecting the CNS from injury and disease The BBB is made up of three biological components of the brain microvasculature brain endothelial cells BECs astrocyte end feet and pericytes PCs BECs are essential components of the BBB responsible for protecting the brain from pathogens while also limiting the flow of circulatory factors Astrocytes which are five times the number of neurons in the CNS provide simple structural and nutritional support for neurons and also contribute to the composition of the BBB Pericytes play an essential role in angiogenesis vascular remodeling vascular tone and BBB development Several neurologic diseases such as stroke and neuroinflammatory disorders are affected by the BBB dysfunction This book presents researches and studies performed by internationally acclaimed experts on the role of blood brain barrier It will serve as a valuable source of reference for graduate and post graduate students

permeability barrier formed by a continuous layer of specialized endothelial cells endowed with important permeability transport and regulatory functions that both protect the internal milieu of the brain and allow essential nutrients to be transported into the brain. Abnormalities of the blood brain barrier are increasingly recognized as a key component in the pathogenesis of a range of primary diseases of the brain and the secondary involvement of the brain from pathological processes in other organs. In *The Blood Brain Barrier in Health and Disease* Volume 2 international experts present comprehensive reviews and research accounts on blood brain barrier dysfunction in infectious and inflammatory diseases, cerebrovascular diseases, stroke, trauma, vitamin deficiency, exposure to neurotoxicants, primary and metastatic brain tumors, and neurodegenerative diseases. This book is intended to serve as a guide and reference to basic and advanced information for researchers, students, and clinicians interested in this fast expanding field and stimulate further research well into the future.

Radiopharmaceuticals and Brain Pathophysiology Studied with PET and SPECT M. Diksic, Richard C.

Reba, 2021-09-28 First published in 1991 this book covers three major areas essential to in vivo biochemical studies with PET and SPECT: synthesis of radiopharmaceuticals, biological modeling, and clinical applications. The book emphasizes advances in the synthesis of radiopharmaceuticals used in PET and SPECT studies of brain flow and oxidative metabolism, in addition to biological modeling. The most widely used 2-deoxyglucose and 2-fluorodeoxyglucose models are discussed, as well as models used in the quantitation of brain receptors. Other topics include a possible model for converting 6-¹⁸F fluorodopa images into the quantitative rate of dopamine synthesis, evaluations of technetium and iodine labeled blood flow tracers, and possibilities for using SPECT to measure other pathophysiological variables. This book will be a valuable reference source to students and specialists interested in these in vivo measurements.
