Santini,Seamus A. Ward,2018-10-03 Up to 200 million people in 70 countries are at risk from drinking water contaminated with arsenic which is a major cause of chronic debilitating illnesses and fatal cancers Until recently little was known about the mobility of arsenic and how redox transformations determined its movement into or out of water supplies Although human activities contribute to the release of arsenic from minerals it is now clear that bacteria are responsible for most of the redox transformation of arsenic in the environment Bacterial oxidation of arsenite to the less mobile arsenate has been known since 1918 but it was not until 2000 that a bacterium was shown to gain energy from this process Since then a wide range of arsenite oxidizing bacteria have been isolated including aerobes and anaerobes heterotrophs and autotrophs thermophiles mesophiles and psychrophiles This book reviews recent advances in the study of such bacteria After a section on background geology and health issues the main body of the book concerns the cellular machinery of arsenite oxidation It concludes by examining possible applications Topics treated are The geology and cycling of arsenic Arsenic and disease Arsenite oxidation physiology enzymes genes and gene regulation Community genomics and functioning and the evolution of arsenite oxidation Microbial arsenite oxidation in bioremediation Biosensors for arsenic in drinking water and industrial effluents      *Library of Congress Catalogs* Library of Congress,1982      **Federal Register** ,1976-08      **Catalog of Copyright Entries** Library of Congress. Radziejewska, 2017-04-04 This is the first comprehensive science based textbook on the biology and ecology of the Baltic Sea one of the world's largest brackish water bodies. The aim of this book is to provide students and other readers with knowledge about the conditions for life in brackish water, the functioning of the Baltic Sea ecosystem and its environmental problems and management. It highlights biological variation along the unique environmental gradients of the brackish Baltic Sea Area: the Baltic Sea, Belt Sea and Kattegat, especially those in salinity and climate. pt font family Arial sans serif color 262626 The first part of the book presents the challenges for life processes and ecosystem dynamics that result from the Baltic Sea's highly variable recent geological history and geographical isolation. The second part explains interactions between organisms and their environment including biogeochemical cycles, patterns of biodiversity, genetic diversity and evolution, biological invasions and physiological adaptations. In the third part, the subsystems of the Baltic Sea ecosystem: the pelagic zone, the sea ice, the deep soft sea beds, the phytobenthic zone, the sandy coasts and estuaries and coastal lagoons are treated in detail with respect to the structure and function of communities and habitats and consequences of natural and anthropogenic constraints such as climate change, discharges of nutrients and hazardous substances. Finally, the fourth part of the book discusses monitoring and ecosystem based management to deal with contemporary and emerging threats to the ecosystem's health.
